<< I am not able to adjust the bias voltage to the
specified level. It stays at around 3v. The oscillator
will work occasionally, and I tried cleaning the switch
to get it more reliable with some contact cleaner and now
I cannot get it to work at all with the case on. >>

Paul-

Although I was happy with the power supply modification, I wasn't happy with the way the oscillator turned out.

One thing you can try is using the contact cleaner on the contact blades to the rotors of the tuning capacitor. It seems that at least one of the two rotors is insulated from ground, so both sets of contacts need to be clean and have good tension.

Problems I encountered include not oscillating, distortion and frequency errors, all at different frequency band and dial settings. I never was able to make it perfect (or even meet specs), but got it to work fairly consistently. I plan to take another look to see if adding capacitors across the zeners might help. That sounds like a good idea.

<< I've had good luck with a
variable HV DC supply. I bring up the voltage, albeit slowly, while
monitoring current with a microamp meter. It's nice to watch the
current gradually go lower, then I step up about another 50 volts or
so then watch it go lower again until I reach the rated voltage of the
cap. I let it "Cook" there for awhile then use the cap. >>

Tony & Mark-

I consider ten-year-old electrolytics to still be "new", and of a newer generation than those that established a reputation for going bad when first powered-up after being in storage. Its those thirty and forty-year-old capacitors I worry about!

I have an old Eico capacitor checker with the "electric eye" indicator for leakage. The voltage is also somewhat current limited. Years ago when I was working with it, I would connect an old electrolytic to it and raise the voltage until the eye just closed. Depending on capacitance and leakage, the eye would slowly open. I would then continue raising voltage and waiting for the eye to open, until the rated voltage was reached, typically 450 volts.

This is equivalent to forming a capacitor by using the variac or series light bulb. I never worried about cooking it, since there was obviously no leakage soon after full voltage was reached. I think you will find those that still have leakage after several minutes, are beyond help. (Obviously ten mfd will charge a thousand times more quickly than 10,000 mfd.)

I think I'll go reform the capacitors in my capacitor checker!

No Cecil,

He said he uses the tape to hold the mount - he then detaches the head from the mount
to conceal it.

From: M1JDK <mark.morris.at.speed-mail.co.uk>
Message-ID: <3f91c50f@news.greennet.net>
Source record: 26082

Hi all,

Recently bought an almost new ATU as above, but have just tried it with a bit more power than the IC-751A delivers by using a Zetagi B300P amp on 14MHz (tested before connecting up with a dummy load and got about 175W for 8W in).

Problem is, when I opened the trimmer inspection lid to tweak the trimmers, I noticed a funny smell - that acrid one of a transistor burning... I'd only keyed up for maybe a minute in total.

It still seems to work OK, although it doesn't seem to tune in the bottom end of the 14MHz band quite as well as it used to, and when I opened the lid, the smell seems to be concentrated around the left of the motor control board, behind the front panel. No sign of any bubbling components, and having let the air circulate, the smell has died down.

Any ideas ? I had thought (in hope) that perhaps it was the big tuning capacitors getting warm for the first time or similar, but the sod's law isn't that kind! I've removed the amp, and given up on that idea, but do you think I should investigate further, or leave well alone and keep my fingers crossed ?

Thanks for any help,
Mark - M1JDK

The problem in the States is that the ITU does not pay PAC bribes to Congress for overlooking the obvious, and political hack FCC commissioners have no concept of the technology they are supposed to be regulating. But, what do expect out of a group of lawyers who were hired based on what they could do to bring home the bacon to Congress from rich special interest groups? But who knows, maybe a bunch of US hams buying 10 KW linear amplfiers will help the economy out and return Congress to a balanced budget for one more blue-moon occasion? Yeah, sure - that's it, BPL will save the U.S. economy.

This may be true.
But if we (the USA) are treaty bound to the ITU; this treaty is
first in the heirarchy of laws in the USA (it is in the Constitution) ;-)
Thomas Jefferson and other "founding fathers" were very serious when they
warned the new nation to take making treaties very seriously.

Maybe these political are reading this post, I hope. In all cases we all hope that the ITU WP 6E's report will be in favor of spectrum users without modifying our rights to use amateur bands as we already observed in UHF, 1.2 and 2.4 GHz some years ago, that were partly reassigned....

Hi

If you are looking for software which enables you to use
PSK,RTTY,CW,SSTV,AX25 etc etc from your PC and soundcard then take a peek at
my download page.

http://www.g3vfp.org/download.html

Enjoy your radio

Dave G3VFP

Correct. The best solution to ensure our defense should be to have in our
camp a Congressist and OM (like K4TPJ and others) or a big spectrum user
(like K6EWP directing the US Strategic Command) who could speak for us all.
It should be interesting to get their opinion. Affair to be followed.

I have for sale an extremely mint Yaesu VR-5000 wide band receiver. The
following options have been installed:
FVS-1A - Voice Synthesizer
DSP-1 - DSP Unit
DV-4 - Digital Voice Recorder

I am the original non smoking owner and have all of the boxes and paperwork
that came with the radio and the accessories. This receiver has seen very
little use. I am asking $550.00 plus shipping from 48026.

Indeed and lobbying are often link to financial interests. Noone broadcaster (and still less with the future DRM, the digital AM) will never accept that its spectrum be reduced but the one of hams could be...

There is maybe one way to fight against a potential reduction of our bands or increasing of the noise level.
A good way to make the pressure on ITU in order that they protect our rights, IMHO, should be to request the help of some famous people. There are so many celebrities whose voice carries around the world and who are licensed hams (statemen, royalties, CEO of telecomm and Internet companies, TV producers, Gen. of US forces and scientists Nobel prices) that if ITU could have their support, the conclusions of their future report could change a lot...

All these hams want that our bands be preserved but there are also involved in the use of the spectrum. They could arg in our side.
See some names on : http://www.astrosurf.com/lombry/qsl-rfi-bpl.htm (first half).

But maybe that I dream alive

I have for sale a SBE Sidebander II, Model 121CB/T, 23 Channel Transceiver that has been converted to the 10 Meter Ham Band. It covers 28.510 to 28.800. It has a Clarifier that provides for coverage in between channels. This rig runs 12 Watts PEP. It works on LSB and USB and AM. It comes with the original SBE hand Mic, the Mobile Mounting Bracket, the Power Cord. It has an effective Noise Blanker. The transceiver looks and works great. Price is $35 and I will split shipping costs. Thanks, Charlie Hugg, K5MBX

Check for "Burnt PCB", Relay Points. and shorted Caps. These type tuners
are designed to be tuned at LOW Power levels. (Like less than 30 watts)
and when they are finally tuned then they can accept Full Power. The
RF Harris Autotuner that can handle 1KW CW Is 10 times the size and has
10 times the voltage ratings, and it tunes at the 100 watt level. before
going to Full Power..... You can't get something for nothing, you can
get what you pay for......Most of the time...

Source record: 25952

<< I have an older Icom PS15 power supply. I understand that when you use it with a 706 which I am using, or any of the newer radios designed for it, it should not turn on until the on button on the radio is pushed. This one, when used with the 706, seems to turn on when it is connected to the radio whether the on button is pushed or not. >>

Michael-

This may not be the same as an old Kenwood power supply made back in the 70s for use with the TS-120S transceiver. That transceiver had an extra set of contacts on its power switch, that were wired through the power connector. The power supply (PS-30?) had a hard-wired cable with a pair of wires connected across its internal switch. Either the switch on the power supply or the one in the TS-120S would turn it on, as I recall. If you only turned on the power supply's switch, the TS-120S wouldn't come on until its switch was also turned on.

Many modern transceivers, including both Kenwood and Icom, use the same connector as the old TS-120S, but there are two pins not used. If you used the modern transceiver with the old Kenwood power supply, the transceiver's power switch only switches the 12 volt line.

Does this discussion relate to the PS-15? If it has all six wires present in its connector, then it may be the same. If two are missing, then it may have some kind of sensor that detects a load and applies full power. If so, that circuit may be malfunctioning in yours.

What???!!! Do you mean to tell me that there were no WMDs found, weak
and embargoed Iraq posed no imminent threat to anyone, Hussein's nuclear
program was a work of fiction *and* there was absolutely no connection
to 9/11?

[Gasp!]... but that could mean one thing only: president Wolf... I mean
president G.W.Bush and his cronies lied to the American people!!!

Hmm, politicians lying to their constituents to the point of having
hundreds of lost lives in order to satisfy the lobby of a foreign
country, while filling their pockets in the process? No fucking way!
There's gotta be a more rational explanation. This must be a vast
liberal-anti-Christian-communist-leftist-atheist-terrorist-Clinton-UN-Franco-German
conspiracy. Yeah, that's what it is. Whew! Life makes sense again.

So one question was how long the UN was going to allow its own
resolutions to be ignored by Iraq?

What GWB did was possibly necessary, that can be argued. His
motivations for doing this are unclear.

As to whether or not the world is better off now, hard to say....

As to the WMD... remember that 30,000 gals of nerve agent is roughly
what will fill an average swimming pool, and can be buried by a
determined man with a bobcat (small tractor) in a day or less...

Interesting question if saddam was lied to by his own people...
considering that he was of the "shoot the messenger" persuasion...

So if he demanded the weapons, and they didn't exist, HE was lied
to.... Interesting thought, no?

The 706 does not have a true on/off switch as such. The power is connected all the time and the on/off switch only turns a switching circuit off and on sort of like the way the ATX computers power supplies work. Several of the newer rigs are this way.

3838. Adding courtesy beep to a Hamtronics COR-2 ???

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-20 03:37:48 UTC
From: eclip01 <eclip01@hotmail.com>
Message-ID: <gMIkb.4178$Uz6.635@newsread1.news.atl.earthlink.net>
Source record: 25961

I was wondering if anyone has added a courtesy tone
to the COR-2 board in the old hamtronics repeater?
I know it would be easier to upgrade the controller,
but it would be fun to mod the COR-2 if possible.
Thanks for any help...

3839. Re: Adding courtesy beep to a Hamtronics COR-2 ???

If I'm not wrong, I think Hamtronics makes a plug in board you can buy
extra. If not, some of the repeater books have circuits that should be able
to be built and installed rather easily.

What is the problem here? _REAL_ Radio Hams work with
signals that are deep in the noise all the time. There might be
a concern here by CBers who want S9 BBC quality, but
not for Radio Hams!

The problem is that this particular noise source produces 40dB OVER S-9 QRM
at 150 feet from the source... IIRC what I have read correctly..

I'm not sure that it would possible Gareth to the extent needed.
The problem is that local noise depends on the activity of local PLC
modems, each of which is going to produce an additive but independent QRM.
You wouldn't know beforehand when data was going to be requested or sent.
It just sounds like random data bursts spread over a wide spectrum.
Yes, some suppression might be possible by taking a wide bandwidth and
somehow using cancellation. But getting 40dB or more of rejection I
think would be very difficult.

The galling thing about PLC/BPL is that the vested interests (i.e. the
power companies) seem to think that they can ignore all other spectrum
users. Yet the bandwidth they're offering will soon be insufficient
to meet the broadband demands. At least with ADSL line bandwidth can be
shared among a small number of subscribers. Greater bandwidth can be
achieved by reducing that contention ratio. But I wonder how many houses
are served by the same power substation on average. IMO, PLC/BPL is
the wrong technology too late. Even ADSL is going to struggle to meet
the bandwidth for on-demand video streaming.

As a final irony, now that the ITU has dropped mandatory CW, CW with
its much lower bandwidth offers the best chance in the presence of
such wide spectrum noise. Looks like my pursuit of CW as a mode was
worth it after all ;-)

The PIC STV5730A on screen display project board provides a simple platform for the development of microcontroller driven text over video applications. It is ideal for creating on screen displays for ATV applications such as callsign generation.

For the non-programmer a PC keyboard interface version allows easy creation of on screen displays.

The PIC STV5730A on screen display project board is available from http://www.STV5730A.co.uk

Features:
* 16F628 microcontroller for flexible development
* STV5730A on screen display IC gives 28 character by 11 row screen
* 128 text and graphics characters defined in ROM
* Text over video or self generated video signal
* 10 i/o lines on the 16F84 for easy interface to sensors, keypads, etc
* Power supply 5V dc or 9 - 12dc via on board regulator
* Free PIC-STV5730A demo software in assembler & BASIC
* Screen display routines available
* Simple PC serial interface, ATV callsign and GPS display examples
* Enclosures available
* Accessories and connecters

Cut out the tedium of project development and get straight to the fun of making your idea work with proven hardware and well commented easy to understand example code.

I do not think it is possible to remove these bursts, all the more that they
are random.
See example of noise recorded in Austria on
http://www.astrosurf.com/lombry/qsl-rfi-bpl.htm, amazing !
and a compilation on http://www.arrl.org/tis/info/HTML/plc/#Video

The majority of the Senators are lawyers, and over 1/4th of the House members are lawyers. Incapable of learning 5 w.p.m. Morse code. Maybe when everything is no-code, a few of them could memorize enough right answers to get a ticket. Maybe the FCC should just give out free Extra-class licenses to all of Congress in hopes they might learn something about communications. Better yet, give out free licenses to the FCC commissioners. Heck, they are all lawyers without a clue on communications or technology.

Is that why CBers use echo boxes so they can sound like SSB voices, without
the carrier insertion?

Mmm?
There is a software accessible to amateurs that can detect signal 10 dB
below the noise : FFTDSP
See my commentaries on http://www.astrosurf.com/lombry/soft-calc.htm#FFTDSP
and a small review in French at the end of this page,
http://www.astrosurf.com/lombry/satellites-artificiels5.htm
It is not much different from a SETI application.

3856. How do you like your Icom 703?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-20 18:17:32 UTC
From: k5dh@raytheon.com
Message-ID: <0FVkb.56$b77.149@dfw-service2.ext.raytheon.com>
Source record: 25979

I am a (happy) Yaesu FT-817 owner. I've thought about buying an Icom 703. '703 owners, how do you like 'em? Anyone who owns or has owned both, can you compare the '703 to the '817 from your own personal experience? I like the idea of a built-in ATU, although the LDG Z-11 that I use with the '817 certainly performs very well and it can load end-fed wires (something the '703 ATU isn't supposed to be capable of). Let's hear the good and the bad about the '703.

Let's try to confine this to just the question I ask, and not let it degenerate into a "my rig's better than your rig, and your opinion is wrong" session.

73/72,
Dean K5DH/QRP

Press and hold the N.R. + USB/LSB buttons while turning the rig on. The display will show the word "ADJUST" and then go into the service menu. Make sure you write the settings down before making any changes. This menu allows you to adjust individual band output, s-meter calibration, squelch, ALC and so on. You know, all the things that should be left alone. That is why is is called the SERVICE MENU. However if your output power is low, you can fix it here. On a tone my 570SG will put out 110W. I wouldn't go much higher and it won't make a difference on the other end anyway. Also you can adjust the carrier points for USB and LSB. Handy if you run a wider bandwidth with a good mic and EQ setup. With the stock filter replaced I can get about 3.5 KHz wide or 2.4 with the stock filter.

The "Woodpecker" wasn't "supposedly" random, it was pseudo random - not the same thing at all.

In fact, successive pulses even had 'glitches' in the same position - an artefact of the way the short pulses were generated from a long (31 or 33- it was along tome back) bit sequence.

As the whole idea was to give a predictable "compressed pulse" the thought that is could be "supposedly" random is not creditable.

I already thought so.I plan to use the FT-8900 in my car,and it would have
been a pretty good deal replacing my cb radio with the ft-8900

3862. Re: How do you like your Icom 703?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-20 22:09:31 UTC
From: Thomas Krull <df1hx@t-online.de>
Message-ID: <bn1mer$5dl$1@df1hx.dialin.t-online.de>
Source record: 25985

Hi Dean and all other readers in the group !
Some comments from the other side of the pond...

I own an IC-703 about 5 months, never owned a FT-817.
However i had the opportunity to play with a FT-817 twice during fieldday. I liked the receiver of the FT-817 but do not care for the small diplay, the menus and handling of the unit. I know one OM who ran into trouble with the finals of the FT-817 due to unstable power supply and the service of Yaesu here in Europe has some bad reputation.
Those were the reasons to wait for the IC-703 instead getting a FT-817 for QRP operation. I got the IC-703 about five months ago and i am very pleased with it. The receiver is nice, i like it better than the IC-706MkIIG i have here in my shack as well. I use the IC-703 with the MP-1 portable antenna or with a GP (Fritzel GPA-50) when in the shack at home. I got some unsoliticed comments about the nice modulation when operating SSB with the stock mike of the IC-703, however i mostly do CW with the radio, the optional, narrow filter FL-53A is great in this mode, especially on 40m.
The menues/handling are almost similar to the IC-706, the large display helps a lot. The IC-703 has many options to configure it to low power consumption, that helps a lot while being portable. Doing QRPP is fun as well, the power output is adjustable in 0,1 watts steps down to 0,1 watts minimum output.
The ATU does fine with the 1:3 SWR of my 40m dipole at home, when being portable i "tune" the MP-1 antenna, so i do not use the ATU there.
I removed the tension latch of the VFO knob, gives a much smoother feeling, with the latch the knob always feels a little "scratchy".

I had to claim warranty, since the keyer played crazy at 30m due to the radio being much too sensitive about stray HF. More about this in message <bcqns3$3f5$1@df1hx.dialin.t-online.de> and details about the solution of the problem in <bepfal$2da$1@df1hx.dialin.t-online.de>, ICOM (Europe) fixed the problem and it never occured again.
There were no other problems with the IC-703 yet, i really enjoy the radio doing QRP portable/mobile and at home.

Kenwood TK-830 UHF 35 Watts!
Alpha Numeric Display
PL/DPL 160 Channels
450-470 MHz Also
can be tuned to 438-480
I'm told, But you would have to get someone to tune it on those
frequencies, I don't know how.
Comes with Microphone/Power Cable/Speaker wire is cut, But works.
Kenwood radio works GREAT!!!
At a GREAT PRICE!!! 145.00

Same with my 2000 Ranger. There are 1" holes under the floor mats on
both the driver and passenger side near the seat fronts. You can
easily find their locations by crawling under the vehicle. Remove the
grommets (or cut a hole in them) and then the path from the rig to the
battery and antenna is easy.

I purchased two VC-25 VOX headsets for my wife and I and, as it turned
out, only ended up using one. It's in new condition in the box --
just missing the plastic wrapper.

Pick it up in Annapolis, MD; or I'll be happy to ship it!

Email for more information, tests, etc.

Yaesu VC-25 VOX headset (Yaesu VX-5, VX-7, VX-1, VX-2, etc.) - $50/obo
* Tested to work with Yaesu VX-5 and VX-1
* VOX works well for hands-free operation (I use mine in the car)
* Bought two and only ended up needing one!
* New in box (though out of plastic wrapper)

I doubt "Argumentum ad Populem" can be applied to a draw full of sock
puppets ;-)

Either way, an analysis of the pulses showed it wasn't random and, to the
rational person, analysis out weighs "supposed"- regardless of how many of
Gareth's sock puppets do the supposing. .

> and not let it degenerate into a "my rig's better than
> your rig, and your opinion is wrong" session.

- just came back from a week in the mountains with an ft-817
and i'm quite happy with the experience (many phone
contacts at 2,000-4,000 miles, with one 3,800-mile QSO
at .5W!)

- there was a good rundown on the ic703 yahoo groups in the
past few days on a comparison of the rigs and an LDG Z11
tuner

- i like the looks of the 703, and a bigger LCD would be a
bonus (i can't tell, even with my glasses on, what offset
is being displayed for 2M on the ft-817... the '-' or '+'
is *that* small)

- the upshot of the yahoo rundown was that the 703's built-in
tuner doesn't have the matching range of the Z11, but it
is built in!

- another factor is the built-in DSP for the 703
(there is a DSP unit available for the ft-817)

- the 703 has been deemed to have a better receiver

- the 703's controls are larger (i have to admit that the
'dimple' on the ft-817's VFO is a joke unless you're a
QRP munchkin)

- in either case, unless you do a mod, you'll need a balun
for ladder-line or random wire or non-resonant antennas
when used with either unit

- for my money, the ft-817 is a better deal, as it runs for $559 right now, offers internal battery capability, and more bands

- realistically, is 8-10W out any better than 5W out? dunno...

- will i get a 703? most likely! i love new toys!

:-)

Thanks for the tips bruce. Yes, I've played around a bit now and realised that although the book specifies 50W as the minumum power for auto tune, I can get away with about 10W in preset mode before I switch to auto - much safer. My excuse (and I'm sticking to it :) is that the handbook has suffered a bit in the Japanese to English translation...

Thanks again,
Mark.

3890. Ready to upgrade... what HF xcvr features do you like?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-22 01:47:31 UTC
From: Jim Kalafut <kalafutj1@yahoo.com>
Message-ID: <PkIlb.603335$Oz4.613379@rwcrnsc54>
Source record: 25913

I've had a TS-520S with a vertical antenna since I became a ham. I finally have an opportunity to upgrade, and I'm looking for a used digital rig that will offer some key features. Unfortunately, I'm not familiar enough with most modern feature sets to help narrow down the field of eligible rigs. The key motivators for my desire to upgrade are:

1. Better filtering. SSB is ok on the TS520, but the CW is a little too wide and the correct filter would buy 1/3rd of a used rig!
2. WARC band support.
3. No tuning. (This isn't a really big deal...could live w/o.)
4. General coverage receiver.
5. Antenna tuner if possible. With only a vertical, most of 80m and a lot of 40m are too high of SWR.
6. Computer interface. (This is more icing than cake.)

Above all, however, would be the expectation that the basic TX and RX quality be comparable to the TS-520S.

I'd like to know if there are some features of more modern digital rigs that I will find useful. Keep in mind that my operating habits are casual ragchews and some DX chasing, but not contesting. Any additional criteria for my search would be appreciated, and feel free to endorse rigs as well!

Thanks,
Jim (KB9DNA)

3891. Allied SX-190 / AX-190 receiver info

Newsgroup: rec.radio.amateur.equipment

You can download a ton of Allied SX/AX-190 receiver information
in a single, 2.2 MB .pdf file here:

http://www.rehorst.com/mrehorst/Allied-SX-190-Info-Oct02.pdf

The file includes:
Allied Radio Shack Service Manual
Allied Radio Shack Owner's Manual
Ad from CQ magazine, May 1972
Ad from Radio Shack catalog
Review from 73 magazine
NASWA review by Ed Shaw
QST magazine modifications
CQ magazine mods, March 1973, by Bruce Mackey
Bandswitch mods by John Kolb
NASWA-FRENDX mods by Ed Shaw, May 1974
Comprehensive Technical Manual by Ed Shaw
Getting Reacquainted with the SX-190 by Ed Shaw, 4/77
Allied SX-190 Revisited, by Ed Shaw, 6/82

Thanks to Bob Bachus for converting everything to .pdf format!

If anyone has cleaner copies or additional info, I'd like to add
it to my collection. Please email markatrehorst.com (replace at with,
well, you know...)

Thanks!

I would like to sell the following rare, hard to find, and out of print technical books.

Payment: When you buy these books from me, now you can pay me in the U.S. by paypal, money order or check. If you are outside the US, you can buy and pay me now by paypal or money order. You can also pay by bank wire, but I have to charge you the $12 my bank charges me for international bank wires.

Shipping: I will ship your book no later than the next day after I have good payment. You pay $2.00 for media mail or $4.00 for priority mail. I will pay the insurance. For overseas shipping rates, please ask, giving the address the books will be sent to.

Availability: I know that there will be buyers who buy these books right away, and I only have one copy, so it is first come, first served.

Refunds: You may return the book to me for a full refund of the price of the book if not satisfied.

Thank you,

RADIO AND COMMUNICATIONS

SAGA OF THE VACUUM TUBE by Gerald E.J. Tyne, Research Associate of the Smithsonian Institute. Published by Howard W. Sams & Co., Inc. in 1977 ISBN Number 0-672-21470-9. Paperback in Like New Condition. $ 15.96.
RADIO ENGINEERING by Frederick Emmons Terman, Sc.D., Professor of Electrical Engineering, Stanford University. Second Edition. McGraw-Hill Book Company, Inc., 1937 From Professor Rhodes personal library with notes on the inside cover. Hardback. $52.50

EARLY RADIO WAVE DETECTORS, by Vivian J. Phillips, B.Sc. (Eng.) Ph.D., ACGI, CEng., FIEE, FIERE, published by the Institution of Electrical Engineers 1980. ISBN 0-906048-24-9 Good condition. From Professor Rhodes personal library as indicated by his bookplate and name on the insider cover. Hardback.
$65.00

THE CONTINUOUS WAVE ï¿½ TECHNOLOGY AND AMERICAN RADIO, 1900-1932 by Hugh G.J. Aitken published by Princeton University Press 1985. ISBN 0-691-02390-5 Paperback in very good condition. $85.00

S. GERNSBACK'S RADIO ENCYCLOPEDIA 1927 by Sidney Gernsback, published originally in 1927, republished by Vintage Radio Publishers 1974. ISBN 0-914126-06-7. Paperback in Like New condition. $45.00.

WIRELESS COMMUNICATION IN THE UNITED STATES ï¿½ THE EARLY DEVELOPMENT OF AMERICAN RADIO OPERATING COMPANIES by Thorn L. Mayes published by The New England Wireless ands Steam Museum, Inc. in 1989 ISBN 0-9625170-0-3. Paperback in Very Good condition. $39.50.

THE RADIO AMATEUR'S HANDBOOK by the Headquarters Staff of the American Radio Relay League, 1955, 32nd edition. Library of Congress Catalog Card Number 41-3345. Collectible hardback in acceptable condition. $24.50.

ACHIEVEMENT IN RADIO ï¿½ SEVENTY YEARS OF RADIO SCIENCE TECHNOLOGY, STANDARDS AND MEASUREMENT AT THE NATIONAL BUREAU OF STANDARDS by William F. Snyder and Charles I. Bragaw. Published by the U.S. Government Printing Office 1986. Library of Congress Catalog Card Number 85-600619. Hardback in Very Good condition. $99.50.

CABLESHIPS AND SUBMARINE CABLES by K.R. Haigh. Published in 1968 by the United States Underseas Cable Corporation in association with Western Union International. Hardback in Very Good condition. $22.45.

PRINCIPLES OF RADIO COMMUNICATION by John H. Morecroft, Professor of Electrical Engineering, Past President of Institute of Radio Engineers. Published by John Wiley & Sons in 1927. Hardback in Good condition. From Professor Richard A Rhodes II's personal library as proven by his bookplate on the inside cover. $39.50.

RADIO ENGINEERS HANDBOOK by Frederick Emmons Terman, Sc.D. Published by McGraw-Hill Book Company in 1943. Hardback in Good condition. From Professor Richard A Rhodes II's personal library as proven by his signature on the insider cover. $22.50.

EARTH CONDUCTION EFFECTS ON TRANSMISSION SYSTEMS by Erling D. Sunde. Published by Dover Publications in 1968. Library of Congress Catalog Card Number 68-12908. Paperback in Very Good condition. $44.00.

MEASUREMENTS IN RADIO ENGINEERING by Frederick Emmons Terman, Sc.D. Published by McGraw-Hill Book Company 1935. Hardcover. From Professor Richard Rhodes personal library as evidenced by his personal bookplate on the inside cover. $63.00.

GENIUS AT RIVERHEAD ï¿½ A Profile of Harold H. Beverage by Alberta I. Wallen. Published by the North Haven Historical Society in 1988. Signed by the author on the title page. Library of Congress Catalog Card Number 87-62783. Hardcover with dust jacket. SOLD

FROM INVENTION TO INNOVATION Long Distance Telephone Transmission at the turn of the Century by Neil H. Wasserman. 1985 John Hopkins

University Press.
ISBN# 0-8018-2715-9. Hardcover with very good d/j. Condition like new. Price $99.50.

COMMUNICATIONS IN SPACE From Wireless to Satellite Relay by Orrin E. Dunlap, Jr. Revised Edition. Published by Harper & Row 1964. First Edition.
LCC#64-18103. Hardcover no d/j. Condition very good. Price $24.50.
ELECTRONICS

THEORY AND APPLICATIONS OF ELECTRON TUBES by Herbert J. Reich, Ph.D. Second Edition. Published by McGraw-Hill in 1944. In Good Condition. From Professor Rhodes personal library as indicated by his signature in the book. $49.50.

ELECTRONIC FUNDAMENTALS FOR TECHNICIANS by Robert L. Schrader. Published by McGraw-Hill in 1977. Library of Congress Catalog Card Number 77-37105. Hardback in Good condition. $11.95.

ELEMENTS OF SOLID STATE THEORY by G.H. Wannier. Published by Cambridge University Press. 1960. Paperback collectible in very good condition. $18.50.

SAGA OF THE VACUUM TUBE by Gerald E.J. Tyne, Research Associate of the Smithsonian Institute. Published by Howard W. Sams & Co., Inc. in 1977 ISBN Number 0-672-21470-9. Paperback in Like New Condition. $ 15.96.

ELECTRICAL MEASUREMENTS by Arthur Whitmore Smith. Fifth Edition. Published by McGraw-Hill Book Company in 1959. Library of Congress Catalog Card Number 58-11193. From Professor Richard A Rhodes II's personal library as proven by his bookplate on the inside cover. Hardback in Good condition. $6.50.

FUNDAMENTAL OF CIRCUIT THEORY by `Norman Balabanian. Published by Allyn and Bacon 1961 Library of Congress Catalog Card Number 61-13555. Hardcover. From Professor Richard Rhodes personal library as evidenced by his personal stamp on the inside cover. $24.00.

PRINCIPLES OF ELECTRICITY by Leigh Page, Ph.D. and Norman Isley Adams, Jr., Ph.D. Second Edition. Published 1949 by D. Van Nostrand Company.

ELECTRICAL MEASUREMENTS ï¿½ PRECISE COMPARISONS OF STANDARDS AND ABOSLUTE DETERMINISM OF THE UNITS by Harvey L. Curtis. First Edition. McGraw-Hill Book Company 1937. From Professor Richard Rhodes personal library as evidenced by his bookplate and autograph on the inside cover. Hardcover. $86.00.

ADVANCED LABORATORY PRACTICE IN ELECTRICITY AND MAGNETISM by Earle Melvin Terry, Ph.D., and Hugo Barnard Wahlis. Third Edition. McGraw-Hill Book Company 1936. Harcover. From Professor Richard Rhodes personal library as evidenced by his bookplate and autograph on the inside cover. $150.00.

CHARLES STEINMETZ by Henry Thomas. Published by G.P. Putnam's Sons in 1959. Library of Congress Catalog Card Number 59-13608. Illustrated by Charles Beck. Hardcover with dust jacket. From Professor Richard Rhodes personal library as evidenced by his bookplate on the inside cover.

ADVANCED ELECTRICAL MEASUREMENTS by Walter C. Michels. Published by D. Van Nostrand Company in 1947. Hardcover. From Professor Richard Rhodes personal library as evidenced by his autograph on the inside cover. $16.50.

BELL SYSTEM

A HISTORY OF ENGINEERING AND SCIENCE IN THE BELL SYSTEM ï¿½ THE EARLY YEARS (1875-1925) Prepared by Members of the Technical Staff, Bell Telephone Laboratories, M.D. Fagen, Editor. Published by Bell Telephone Laboratories, Inc. in 1975. Library of Congress Catalog Card Number 75-31499. Hardback in Very Good condition. From Professor Rhodes personal library as indicated by his bookplate on the inside cover. $49.50.

A HISTORY OF ENGINEERING AND SCIENCE IN THE BELL SYSTEM ï¿½ NATIONAL SERVICE IN WAR AND PEACE (1925-1975) Prepared by Members of the Technical Staff, Bell Telephone Laboratories, M.D. Fagen, Editor. Published by Bell Telephone Laboratories, Inc. in 1978. ISBN Number 0-932764-00-2. Collectible hardback in Very Good condition. From Professor Rhodes personal library as indicated by his bookplate on the inside cover. $75.00.

A HISTORY OF ENGINEERING AND SCIENCE IN THE BELL SYSTEM ï¿½ PHYSICAL SCIENCES (1925-1980) Prepared by Members of the Technical Staff, AT&T Bell Laboratories, S. Millman, Editor. Published by Bell Telephone Laboratories, Inc. in 1983. ISBN Number 0-932764-03-7. Collectible hardback in Very Good condition. From Professor Rhodes personal library as indicated by his bookplate on the inside cover. $24.90.

THE ANATOMY OF A BUSINESS STRATEGY ï¿½ BELL, WESTERN ELECTRIC, AND THE ORIGINS OF THE AMERICAN TELEPHONE INDUSTRY by George David Smith published by the Johns Hopkins University Press in 1985. ISBN 0-8018-2710-8. Hardback in New Condition $49.95.

THE TELEPHONE ENTERPRISE: THE EVOLUTION OF THE BELL SYTEM'S HORIZXONTAL ARCHITECTURE, 1876-1909 by Robert D. Garnet published by the Johns Hopkins University Press in 1985. ISBN 0-8018-2698-5. Hardback in New Condition $26.95.

ACOUSTICS

ARCHITECTURAL ACOUSTICS by Anita Lawrence. 1970 Elsevier Publishing Company isbn #444-20059-2. Very good condition. Hardcover. No d/j. Pages clean and bright, binding tight. Prof. Rhodes bookplate on back of the front cover. Price $86.00.

PROPAGATION OF WAVES by P. David and J. Voge. First English Edition 1969.
LCC #68-18521. Very good condition. Hardcover with d/j . Clean pages, tight binding.
Price $65.00.

FUNDAMENTALS OF OCEAN ACOUSTICS by L. Brekhovskikh, Yu. Lysanov, published by Springer-Verlag 1982 ISBN 3-540-11305-3. Very good condition. Hardback. $67.95

ACOUSTICS: HISTORICAL AND PHILOSOPHICAL DEVELOPMENT, edited by R. Bruce Lindsay, published by Dowden, Hutchinson & Ross in 1972 ISBN 0-87933-015-5. From the Benchmark Papers in Acoustics Series. Hardback. Very Good condition, $54.50.

PHYSICS

INTRODUCTION TO SPECIAL RELATIVITY, Second Edition by Wolfgang Rindler. Published by Oxford Science Publications 1991. ISBN 0-19-853953-3. Hardback in Like New condition. $52.50.

EXPERIMENTAL ATOMIC PHYSICS by G.P. Barnwell, Ph. D. and J. J. Livingood, Ph.D. First Edition, published by McGraw-Hill Book Company in 1933. A collectible book in acceptable condition. From Professor Richard A Rhodes II's personal library as proven by his signature on the insider cover. $15.50.

MATHEMATICAL STATISTICAL MECHANICS by Colin J. Thompson, published by the Macmillan Company in 1972. Library of Congress Catalog Card Number 77-150071. Hardback in very good condition. $14.55.

ELEMENTS OF HAMILTONIAN MECHANICS by Ter Haar. Second Edition 1964. Published by North-Holland Publishing Company .Very good condition. Hardcover. Clean pages, tight binding, no d/j. Prof. Rhodes stamp on back of the cover. Price $71.27

ELEMENTS OF X-RAY CRYSTALLOGRAPHY by Azaroff. 1967 McGraw-Hill. Good condition. Hardcover. Clean pages, tight binding, no d/j. Prof. Rhodes signature on back of the cover.
Price $75.00

MATHEMATICAL THEORY OF RELATIVITY by Eddington. 1963 Cambridge at the University Press. Soft cover. Good condition. Clean pages, tight binding. Prof. Rhodes bookplate on back of the cover. Price $165.00

HYDRODYNAMICS by Lamb. Sixth Edition. (First American Edition 1945) New York Dover Publications. Good condition Hardcover, clean pages, tight binding. Prof. Rhodes signature on first blank page. Price $95.00.

PIEZOELECTRICITY an Introduction to the Theory and applications of Electromechanical Phenomena in Crystals. By Walter Guyton Cady. New Revised Edition in two volumes. 1964 Dover Publications. Softcover. Clean. Good condition
Price $125.00.

ORGAN BUILDING AND DESIGN by Poul-Gerhard Andersen. Published by George Allen and Unwin Ltd. 1969. Very good condition. Hardcover, No d/j. Clean and tight.
Price $75.00.

PHYSICS OF THE EARTH by Frank D. Stacey. Published by John Wiley & Son 1969. SBN# 471 81955 7. Very good condition. Hardcover, no d/j. Clean bright pages, binding tight. Price $87.50.

BIBLIOGRAPHY OF THE HISTORY OF ELECTRONICS by George Shiers. Published by The Scarecrow Press 1972. ISBN# 0-8108-0499-9. Very good condition.
Clean, tight and bright. Hardcover, no d/j. Price $64.

ELECTRICAL AND ELECTRONIC TECHNOLOGIES: a chronology of Events and Inventors to 1900 by Henry B.O. Davis. The Scarecrow Press 1981. ISBN# 0-8108-1464-1. Condition like new. Collectible: Signed by the Author. Price $25.20.

THE AMBIDEXTROUS UNIVERSE by Martin Gardner. Published by Basic Books 1964. LCC# 64-23953. Hardcover, no d/j. Good condition. Clean pages, tight binding. Prof. Rhodes stamp on back of the front cover. Price $22.50.

KINETICS AND DYNAMICS OF MACHINES by George H. Martin, Revised Printing. Published by McGraw-Hill Book Company in 1969. Library of Congress Catalog Card Number 69-12261. Good condition hardback. $17.50.

INTRODUCTION TO ATOMIC AND NUCLEAR PHYSICS by Otto Oldenbert and Wendell G. Holladay. Published by the McGraw-Hill Book Company in 1967. Library of Congress Catalog Card Number 67-10877. Hardback in Very Good Condition. $12.50.

THE NEW REFORMATION ï¿½ FROM PHYSICAL TO SPIRTITUAL REALITIES by Michael Pupin. Published by Charles Scribner's Sons in 1927. Good condition hardback. $19.45

A TREATISE ON THE MATHEMATICAL THEORY OF ELASTICITY by A. E. H. Love, Fourth Edition, published by Dover Publications in 1944. A hardback book. Collectible in acceptable condition. $19.50.

PROBLEMS IN ELECTRODYNAMICS by V.V. Batygin and I. N. Toptygin. Published by Academic Press in 1964, Library of Congress Catalog Card Number 64-1746. Good condition. From the William Luther Cobb Library. Hardback. $54.50

SOLD A FIRST COURSE IN CONTINUUM MECHANICS, by Y.C. Fung, Second Edition. Published by Prentice Hall in 1977. ISBN 0-13-318311-4. In Good Condition. From Professor Rhodes private collection as indicated by his bookplate on the inside cover. $45.50.

ENGINEERING DRAWING by Thomas E. French, Sixth Edition, published by McGraw-Hill Book Company, 1941, Hardback. Collectible book in Very Good condition from Professor Richard Rhodes personal library as shown

by his signature in the book. $34.50.

A TREATISE ON THE ANALYTICAL DYNAMICS OF PARTICLES AND RIGID BODIES WITH AN INTRODUCTION TO THE PROBLEM OF THREE BODIES by E.T. Whittaker, Professor of Mathematics at the University of Edinburgh, Fourth Edition, published by Dover Publications in 1944. Hardback collectible in Very Good condition from Professor Richard Rhodes personal library as shown by his signature in the book. $30.00

A SOURCE BOOK IN PHYSICS by William Francis Magie, Professor of Physics Emeritus, Princeton University. First Edition. Published by McGraw-Hill Book Company in 1935. Hardback collectible in good condition. From Professor Richard Rhodes personal library as proven by his bookplate and signature. $35.95.

ELECTRON AND NUCLEAR COUNTERS ï¿½ THEORY AND USE by Serge A. Korff. Published by D. Van Nostrand Company, Inc. in 1946. Collectible hardback book in good condition. $24.50.

WAVE PHENOMENA by Dudley H. Towne. Published by Addison-Wesley Publishing Company in 1967 Library of Congress Card Catalog Number 67-15662. Hardback in Very Good condition. Professor Richard Rhodes personal library as proven by his bookplate. $34.50.

ELEMENTARY SOLID STATE PHYSICS by Charles Kittel, Professor of Physics, University of California, Berkeley, California. Published by John Wiley & Sons, Inc.1962 Library of Congress Catalog Card Number 62-17462. In Good Condition. From Professor Richard Rhodes personal library as proven by his bookplate. $29.50.

ATOMIC SPECTRA AND ATOMIC STRUCTURE by Gerhard Herzberg, hardback published by Dover Publications in 1944, second edition. Collectible in acceptable condition. $11.90.

CONCEPT OF MASS IN CLASSICAL AND MODERN PHYSICS by Max Jammer. Published in 1961` by Harvard University Press. Hardback. Library of Congress Catalog Card Number 61-13737. Good condition. From Professor Richard Rhodes personal library as proven by his bookplate. $14.95.

THE CALCULATION OF ATOMIC COLLISION PROCESSES by Kenneth Smith. Published by Wiley-Interscience in 1971. ISBN 0-471-80000-7. Like New condition. From Professor Richard Rhodes personal library as proven by his bookplate. $10.95.

THE GARLAND COLLECTION OF CLASSICAL PHYSICS APPARATUS AT VANDERBILT UNVERSITY by Robert T. Lagemann. Published by Folio Publishers in 1983 ISBN Number 0-9613702-0-3. Paperback $12.95.

THE VARIATIONAL PRIUCIPLES OF MECHANICS by Cornelius Lanczos, Fourth Edition. Published by University of Toronto Press, 1970 70-151376. Hardback in Very Good condition From Professor Richard A Rhodes II's personal library as proven by his bookplate on the inside cover. $19.95

CONCEPTS OF SPACE ï¿½ HISTORY OF THEORIES OF SAPCE IN PHYSICS by Max Jammer. Published by Harvard University Press in 1954 54-8630 From Professor Richard A Rhodes II's personal library as proven by his signature bookplate on the insider cover.
$12.90.

THE NATURAL PHILOSOPHY OF TIME, Second Edition, by G.J. Whitrow. Published by Oxford University Press in 1980. ISBN Number 0-19-858215-3. Paperback in Like New condition. $19.90.

A TREATISE ON THE MATHEMATICAL THEORY OF ELASTICITY by A. E. H. Love, Fourth Edition, published by Dover Publications in 1944. A hardback book. Collectible in acceptable condition. From Professor Richard A Rhodes II's personal library as proven by his signature on the insider cover. $19.50.

COLLISION PHENOMENA IN IONIZED GASES by Earl W. McDaniel. Published by John Wiley & Sons, Inc. in 1964. Library of Congress Catalog Card Number 64-13219. Hardback in Very Good condition. $27.50

INTRODUCTION TO PHYSICAL STATISTICS by Robert Bruce Lindsay. Published by Dover Publications in 1968. Library of Congress Catalog Card Number 68-11966. Paperback in Good condition. $8.90.

INTRODUCTION TO OPTICS ï¿½ GEOMETRICAL AND PHYSICAL by John K. Robertson, M.A., LL.D., F.R.S.C., F. Inst.P. Fourth Edition by D. Van Nostrand Company, Inc. in 1961. Library of Congress Catalog Card Number 54-6281. Hardback in Very Good condition $7.35.

INTRODUCTION TO PHYSICS AND CHEMISTY by Arthur Reiser and Konrad Krauskopf. Published by McGraw-Hill Book Company in 1964. Library of Congress Catalog Card Number 63-22522. Hardback in Very Good condition. $12.40.

THE USE OF ULTRASONICS in Molecular Physics by V.F. Nozdrev. Published by Pergamon Press in 1965. Library of Congress Catalog Card Number 63-18965. Hardback with dust jacket in Very Good condition. $9.95.

RAYLEIGH AND LAMB WAVES ï¿½ PHYSICAL THEORY AND APPLICATIONS by Igor Aleksandrovich Viktorov. Published by Plenum Press in 1967. Library of Congress Catalog Card Number 67-10537. Hardback in Very Good condition. From Professor Richard A Rhodes II's personal library as proven by his bookplate on the inside cover.
$55.00.

SOLD TRANSISTOR AND PHYSICS AND CIRCUITS by Robert L. Biddle and Marlin P. Ristenbatt. Published by Prentice-Hall in 1958. 57-14923. Hardback in Good condition. From Professor Richard A Rhodes II's personal library as proven by his bookplate on the insider cover.
$7.40.

TRANSMISSION-LINE THEORY by Ronold W. P. King, Gordon McKay Professor of Applied Physics at Harvard University. Published in 1965 by Dover Publications. Library of Congress Catalog Card Number 64-8269.

Paperback in Very Good condition. $75.50.

A COLLECTION OF PROBLEMS IN ATOMIC & NUCLEAR PHYSICS by I. Ye. Irodov. Translation from the Second Edition. Published by Pergamon Press in 1966 Library of Congress Catalog Card Number 64-25444. Hardcover with dust jacket in Very Good condition. $52.50.

APPLIED THERMODYNAMICS by Virgil Moring Faires. Published by The Macmillan Company in 1943. Hardback in Very Good condition. From Professor Richard A Rhodes II's personal library as proven by his signature on the inside cover. $11.45.

THERMOPHYSICS by Allen L. King. Published by W. H. Freeman and Company in 1962. Library of Congress Catalog Card Number 62-8209. Hardback in Good condition. $9.45.

THE STRUCTURE OF LINE SPECTRA by Linus Pauling and Samuel Goudsmit. Published by McGraw-Hill Copyright 1930. Paperback in Very Good condition. From Professor Richard A Rhodes II's personal library as proven by his personal stamp on the inside cover. $19.95.

ATOMS, MOLECULES AND QUANTA by Arthur Edward Ruark and Harold Clayton Urey. Volumes One and Two of the two volume set. Dover Publications 1963. Library of Congress Catalog Card Number 63-19499 Paperback in Very Good condition. $20.45 for the set.

BASIC PRINCIPLES & LAWS OF MECHANICS by Alfred Zajac. Published by D.C. Heath and Company Library of Congress Catalog Card Number 66-12390. Hardcover. From Professor Richard Rhodes personal library as evidenced by his personal stamp on the inside cover.

STATISTICAL THEORY OF LIQUIDS by I. Z. Fisher. Published by the University of Chicago Press 1964. Library of Congress Catalog Card Number 64-22249.
Hardcover. From Professor Richard Rhodes personal library as evidenced by his personal stamp on the inside cover. $90.00.

INTRODUCTION TO PHYSICAL STATISTICS by Robert Bruce Lindsay. Published by John Wiley & Sons 1941. Hardcover. From Professor Richard Rhodes personal library as evidenced by his autograph on the inside cover. $49.50.

HIGH-PRESSURE MEASUREMENT, edited by Guardini and Edward C. Lloyd. Published by Butterworths in 1963. Library of Congress Catalog Card Number 63-20264. Hardcover. $120.00.

THE MOLECULAR THOERY OF FLUIDS by Herbert S. Green. North Holland Publishing Company `1952. Hardcover. From Professor Richard Rhodes personal library as evidenced by his autograph on the inside cover.

THE STATISTICAL MECHANICS OF SIMPLE LIQUIDS by Stuart A. Rice and Peter Gray. Published by Interscience Publishers in 1965. Hardcover. From Professor Richard Rhodes personal library as evidenced by his personal stamp on the inside cover. $85.00.

X-RAYS IN THEORY AND EXPERIMENT by Arthur H. Compton (Nobel Laureate) and Samuel K. Allision. Published by D. Van Nostrand Company in 1935. Hardcover. From Professor Richard Rhodes personal library as evidenced by his autograph on the inside cover.

INTRODUCTION TO PHYSICS AND CHEMISTRY by Arthur Beiser and Konrad Krauskopf. Published by McGraw-Hill, Inc. in 1964 Library of Congress Catalog Card Number 63-22522. Hardcover. $7.00.

HANDBOOK OF ELEMENTARY PHYSICS by Robert Bruce Lindsay. Published by the Dryden Press 1943. Hardback. From Professor Richard Rhodes personal library as evidenced by his autograph on the inside cover. $25.00.

CHEMISTRY

CHARACTERIZATION OF ORGANIC COMPOUNDS BY CHEMICAL METHODS by Terence C. Owen. Published by Marcel Dekker in 1969. ISBN Number 0-8247-1510-1. In Like New condition. $14.00.

THE SPECTRA AND STRUCTURES OF SIMPLE FREE RADICALS ï¿½ An Instructi8on to Molecular Spectroscopy by Gerhard Herzberg. Published by Cornell University Press in 1971. ISBN Number 0-8014-0584-x. From Professor Richard A Rhodes II's personal library as proven by his bookplate on the insider cover. $18.75.

BASIC INORGANIC CHEMISTY by F. Albert Cotton and Geoffrey Wilkinson. Published by John Wiley & Sons in 1976. ISBN Number 0-471-17557-9. Hardback in Very Good condition. $14.50.

SOLUTIONS MANUAL FOR FUNDAMENTALS OF ANALYTICAL CHEMISTRY, Fourth Edition by Douglas A. Skoog and Donald M. West. Published by Saunders College Publishing in 1982. ISBN Number 0-03-0548461-2, Paperback in Very Good condition. $12.95.

PHYSICAL CHEMISTY by Farrington Daniels and Robert A. Alberty. Published by John Wiley & Sons, Inc. in 1955 Library of Congress Catalog Card Number 55-5480. Collectible book in Good condition. From Professor Richard Rhodes personal library as proven by his signature. $24.95.

MOLECULAR STRUCTURE AND THE PROPERTIES OF LIQUID CRYSTALS by G. W. Gray. Published by Academic Press in 1962. Library of Congress Catalog Card Number 61-18803. Hardback in Very Good condition. From Professor Richard A Rhodes II's personal library as proven by his personal stamp on the inside cover. $7.85.

EXPERIMENTAL SPECTROSCOPY by Ralph A. Sawyer. Published by Prentice-Hall in 1944. From Professor Richard A Rhodes II's personal library as proven by his autograph on the inside cover. Hardcover in Very Good condition. $9.90.

KINETIC THEORY OF LIQUIDS by J. Frenkel. Published by Dover Publications in 1955 by special arrangement with Oxford Press. Hardback in Good condition. From Professor Richard A Rhodes II's

personal library as proven by his autograph on the inside cover. $18.50.

EDWARD WILLIAMS MORLEY ï¿½ His Influence on Science in America by Howard R. Williams. Published by the Chemical Education Publishing Company in 1957. Library of Congress Catalog Card Number 57-7756. In Fine condition. $22.45.

ORGANIC CHEMISTRY by Louis F. Fieser and Mary Fieser. Third Edition. Published by D. C. heath and Company 1956. Library of Congress Catalog Card Number 56-6691. Hardcover. From Professor Richard Rhodes personal library as evidenced by his autograph on the inside cover. $94.00.

THE CHEMISTRY OF ORGANIC COMPOUNDS by James B. Conant. Revised Edition. By James Bryant Conant. Published by the Macmillan Company in 1939.

THE MOLECULAR THEORY OF SOLUTIONS by I. Prigogine. Published by North Holland Publishing Company in 1957. Hardcover. From Professor Richard Rhodes personal library as evidenced by his autograph on the inside cover. $84.00.

OCEANOGRAPHY

HYDRODYNAMICS by Lamb. Sixth Edition. (First American Edition 1945) New York Dover Publications. Good condition Hardcover, clean pages, tight binding. Prof. Rhodes signature on first blank page. Price $95.00

THE OCEANS by Sverdrup ï¿½ Johnson ï¿½ Fleming. 13th printing 1964 Prentice-Hall.
Good condition. Hardcover, no d/j. Clean pages, binding tight.
Prof. Rhodes
Bookplate on back of the front cover. Price $124.50

STRATEGIC ANTISUBMARINE WARFARE AND NAVAL STRATEGY by Tom Stefanick, published by the Institute for Defense and Disarmament Studies 1987 ISBN 0-669-14015-5 Hardback with Dust Jacket. Like new condition, including the dust jacket. $70.87.

THE SEA FLOOR ï¿½ AN INTRODUCTION TO MARINE GEOLOGY, by E. Seibold and W. H. Berger, Second Edition published by Springer-Verlag in 1993. Hardback. ISBN 0-387-56884-0. Very Good condition. $32.50.

INTRODUCTION TO MINERALS AND ROCKS by Joseph C. Cepeda. Published by Macmillan College Publishing Company in 1994. ISBN 0-02-320452-4. Paperback in Good condition from Professor Richard Rhodes personal library as proven by his bookplate on the inside cover and further illuminated by his notes, underlinings and bookmarks. $39.50.

OCEANOGRAPHY by Jerome Williams of the U.S. Naval Academy, Annapolis. Published by Little, Brown and Company in 1962 Library of Congress Catalog Car Number 62-18105. A collectible hardback book in very good condition. From Professor Richard A Rhodes II's personal library as

proven by his bookplate on the insider cover. $19.00.

PROGRESS IN OCEANOGRAPHY, VOLUME I by Dr. M. Sears. Published by The Macmillan Company in 1963. Library of Congress Catalog Card Number 63-15353. Hardback in Very Good condition. $24.50.

PROGRESS IN OCEANOGRAPHY VOLUME 2, Editor Mary Sears. Published by Pergamon Press 1964. Library of Congress Catalog Card Number 63-15353. From Professor Richard Rhodes personal library as evidenced by his personal stamp on the inside cover. $24.50.

GLOSSARY OF OCEANOGRAPHIC TERMS, 2nd Edition, edited by B.B. Baker, Jr., W. R. Deebel, R. D. Geisenderfer. Published by the U.S. Naval Oceanographic Office. 1966. Hardcover. From Professor Richard Rhodes personal library as evidenced by his personal bookplate on the inside cover.

OCEAN SCIENCES, edited by Captain F. John Long. Published by the Unites States Naval Institute, Annapolis in 1964. Hardcover. From Professor Richard Rhodes personal library as evidenced by his personal bookplate on the inside cover.

OTHER

PRINCIPLES OF STRATIGRAPHIC ANALYSIS by Harvey Blatt, William B.N. Berry and Scott Brande, published by Blackwell Scientific Publications in 1991. ISBN Number 0-86542-069-6. In Very Good condition. From Professor Richard A Rhodes II's personal library as proven by his bookplate on the insider cover. $14.85.

FUNDAMENTALS OF AUTOMATIC CONTROL by Robert C. Weyrick. Published by McGraw-Hill Book Company in 1975. ISBN Number 0-07-069493-1, In Like New condition. $14.50.

FOURIER SERIES AND BOUNDARY VALUE PROBLEMS by Ruel V. Churchill. Published by McGraw-Hill Book Company in 1941. Hardcover collectible book in acceptable condition. $24.50.

THE NEW SOLAR ELECTRIC HOME ï¿½ THE PHOTOVOLTAICS HOW-TO HANDBOOK by Joel Davidson, published by AATC Publications in 1987 ISBN 0-937948-09-8. Paperback in good condition. $11.50.

GREAT MEN OF SCIENCE ï¿½THEIR LIVES AND DISCOVERIES by Grove Wilson. Published by Garden City Publishing Company. 1929. Collectible in Good condition. From Professor Richard A Rhodes II's personal library as proven by his bookplate and signature on the inside cover. $19.95.

DIRECT USE OF THE SUN'S ENERGY by Farrington Daniels. Published by Yale University Press in 1964 Library of Congress Catalog Card Number 64-20913 From Professor Richard A Rhodes II's personal library as proven by his bookplate on the inside cover. Paper back in Good condition. $12.45.

FUEL CELL SYSTEMS, Robert F. Gould Editor. Published by the American Chemical Society in 1965. Library of Congress Catalog Card Number 65-16399. Hardback in Very Good condition. $13.95.

THE BIRTH OF MATHEMATICS IN THE AGE OF PLATO by Francois Lasserre. Published by the American Research Council in 1964 Library of Congress Catalog Card Number 65-16847. Hardback with dust jacket in very good condition. $6.40.

I wonder if this would be the "Phoenix Radio Club" per chance ?

> if i didnt know any better, on emight think that my questiosn were
> being ignored...

Awww, Please dont cry ! I, 2E1TNT am here to help you.
an Ex Military operator, Capable of 25wpm after a 30 minute warm up :-)
also a member of the "Phoenix Radio Club"

But wait !....You say that you want to learn "more" about morse code !

Does this mean you already know some morse code ? How much do you know ?
5wpm perhaps ? or even 12wpm ?

I can teach you as much morse code as you like, BUT I can not teach you
to transmit at 25wpm. To do that you will have to stop whining on this NG
and spend the wasted time on PRACTICE PRACTICE PRACTICE.

Have a nice day.

YOur best bet would be to do some research yourself, the free
user-written product reviews at http://www.eham.net or the ARRL lab
reviews at http://www.arrl.org -- if you don't take QST, it's time you
did, so you can access their online product reviews, which go back 20
or 30 years and cover any used rig you're likely to buy.

> squelch. Sounds like the squelch minimum setting istoo high. Can anyone
> help? Please reply to skudrick@ptd.net. Thanks! N3CNR

You can probably get enough information from the Radio Shack web site and its library of online manuals for their products to make the appropriate adjustment to the internals. Just FYI....

The HTX-100 is a pretty decent radio, too. I had one back in the late 80s. A buddy of mine and I used to drive in to work at Ashton-Tate in Torrance, CA -- same time of day but way different routes so we couldn't carpool -- and yakked on 10m USB on the way in. Tim had a trimmed-down 102" CB whip on his car, while I had a base-loaded mag-mount CB antenna from RS trimmed down to work on 10m. One day we were doing the usual bit and a Ukraine station broke in to say hi. Would you believe he had us both S8 there, and we had his signals at a good S7-plus in both mobiles! One of the best darn QSOs I've ever had!

Three cheers for the HTX-100!

> in-depth opinions to help me decide.

If the Heil Traveler is any gauge, I'd say the Heil microphones are the
best there is. I bought a Traveler (single-earpiece headset and boom
mic) at this year's ARRL Southwest Division Convention, and had
spectacular audio-quality reports whenever I used it.

I believe Joe Walsh has also endorsed the Heil product line. If anyone
on the ham bands would be more concerned with audio quality than a
member of the "Eagles" band, I can't imagine who it would be...!

3922. Radio installation 2001 Expedition

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-23 02:30:07 UTC
From: **THE-RFI-EMI-GUY** <NoSpamBogus@NoSpamBogus.com>
Message-ID: <3F973D2F.4060208@NoSpamBogus.com>
Source record: 25945

Hi I have just recently bought a 2001 Ford Expedition. This model has "bucket seats" and a center console/armrest containing the CD changer. There is literally no room to install a radio in the console, and I want the storage section to keep as is for storage. What I am looking to do is mount the radios (one or two dash mount radios, Motorola Spectra or similar) on an aluminum plate just inside the passenger side of the console unit, near the dash. I figure that putting the radios there will be below the passenger airbag area and will not intrude (too much) into the passenger seat area. I want this arrangement to be extremely mechanically secure and not have to modify the center console in any major (unrepairable) way.

Has anyone done this? I have a plan in my head how to do this, but hate to re-invent the wheel. Are there any commercial mounts like this (Yes I have checked Tessco and Galls).

Bob, I thought the same way some months ago, but ended up checking out some of his listings. Ended up buying two items from him so far, and have been extremely pleased, so it was well worth the slight effort it took to plug in an extra couple of characters. Of course, you can ignore the whole thing and not use any of your valuable time at all, if you wish.

Ed

Source record: 25947

Hi Joe:
Have a 99 Explorer and encountered the same concern. My solution (two years now)was to mount the dash bracket upside down on the radio and rivet two homemade aluminum "J" brackets to the dash mount. Then I opened the console lid and hooked the "J" hooks over the console lip. Radio is out of the way, display can be seen at a glance and best of all, when I park the car in a strange area, I open the lid, lift off the radio and slide it under the seat! Down side you cover the tissue box and cover one "cup holder". Small concern for great bennys! If you would like a detailed drawing of how and also the way I mounted my antenna"without any visible holes!!!" let me know and I can fax the info. Bill

I live in Israel. In order to buy anything that transmits, you have
to get a license from the Ministry of Communication. Amateur radios
are NOT excempt, you have to call a nice lady named Miriam and she
sends you a permit, and adds it to your license.

Not only is the permit necessary, but the tax on electronics is 62%
(used to be 125%), while the tax on ham radio gear is 18%.

I know a medical doctor doing research in the effect of RF on heart patients
who ordered an MFJ tuner from the states for $100 plus shipping. When he
finaly got out of customs the lab had paid $325 for it. (125% tax on the
unit and shipping plus customs fees)

Just imagine if everytime you wanted to buy a radio you had to get
a permit from the FCC. IMHO STAY AWAY FROM IT.

Geoff.

I would ? Why ? The full RAE does not consist of Morse alone
but perhaps you are not licensed and dont know that.

Never assume anything !

There are respected members of two Amateur Radio Clubs here in the Medway Towns who know my Morse capabilities.

Surprising how a simple 2E1 Callsign can make brains tick :-)

Message-ID: <3f992067_2@news.vo.lu>
Source record: 25873

Hi,

I am preparing a webpage about amplifiers.
I am searching arguments to use a kW amplifier. Here are mine. Have you others ? (please stay on the subject, the question is not pro or con amps but finding the "plus" of using a kW amp) .
List an email (ort URL) in the case I need to contact you.
Thanks in advance

Thierry
ON4SKY, LX3SKY
http://www.astrosurf.com/lombry

Introduction :

Imagine that all your hamshack is invaded with rigs and accessories, that your antenna farm, beam, vertical or long wire vertical is performing, proved by your hundreds QSLs received from far DX stations. But sometimes, during pileups or when propagation is closed you have difficulties to work some remote stations or to get good reports exceeding 53-55. On your side you hear them all, not always loudly, but at least 53 or with a strong QRK.

In this case the last thing to install beside your 100 W PEP barefoot transceiver is well a good amplifier, up to your class limit, 400 W, 1 kW or more, depending your national regulation. Good news, you will tell me ! Indeed, but at the condition to use it properly. What we are going to discover.

In all other circumstances, if your RTX is not equipped with performing filters to reduce QRM, if your antenna yield a low gain or is omnidirectional, it will be more useful to improve their performance that using a linear amplifier. In all cases adding an amplifier to your current installation will probably not help you much in working far DX stations that arrive 53 or not at all to you. Improve first your antenna system, then add some filters (Collins, etc), change maybe your transceiver for a more complete model and at last, after one year of experimentation, see if an amplifier is really necessary. This is wiser advice that using an amplifier at all costs and be unable to hear your correspondent. You will make QRM without working any station. This does not respect the ham spirit and is not very useful, all the more that an amplifier is often expensive.

1kW amplifiers
Why god using so much power ? This is a pertinent question. Going up from 100W to 1000 W PEP, the power ratio is 10 and looks high if not huge. But knowing that you add only 3 dB each time you double your power, 1 kW output produces only a 10 dB change on the S-meter, what is not really important.

However your QRK will be much improved and your corespondent will have please to hear you in better conditions, mainly if you work with a directional antenna, in which your can concentrate all your RF signal in some direction.

Something else to say (pro) ?

Thierry

Motorola Spectra UHF Was 175.00 Now 155.00 While they last!!

Good Display and Receive works GREAT and Transmit also works GREAT!!
Now thats a deal!

Motorola Spectra Transceiver UHF Its on 450 MHz now. Model #
D44KMA7JA5BK Range 3 40Watt Comes with Motorola [wire cut]
Speaker
/Microphone/Bracket for radio/Power Cord/Accessory plug/
Scan and alphanumeric diasplay and also do MDC-1200
PTTID Also PL/DPL/etc

Its a 450-482MHz Dash Mount Transceiver. 128 Channels A5 Head
PriceWas175.00 Now 155.00 As Stated Works GREAT!!!

Have about only 9 or so left!!
Will not be Dead on arrival!!

Hello-
Anybody havre or know where to get any of the older numeric digital display units as described-
Beckman # SP-333
" # SP-334
These are plug-in 3 digit units, they have a small pane of glass in front.From late 70's era equip.The #SP-333 is standard, the #SP334 has a dedicated numeral 1 for first digit.
Thank you, Byron WA5THJ.

3956. Problem with a AEA Keyer

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-24 21:00:24 UTC
From: Kirk Mohror <kmohror@comcast.net>
Message-ID: <6Pmdncpm-ZZ1DwSiRVn-iw@comcast.com>
Source record: 25879

I have a Moresmatic MM-1 keyer made by Advanced Electronis Applications.
First, are they still around, if not, did someone assimulate them?

Now the problem. After the keyer has been on for 1/2 to 1 hour, it will only
send A's from both sides of the paddles.
It appears to be a thermal problem because if it is turned off for a while,
it works fine till it "heats" up again.

Suggestions?

Does anyone know if the control heads from the Kenwood TM741 and TM742 are completely interchangeable? I have a TM741 radio and control head and another TM742 control head. Since the 742 head "comes apart" into 2 separate units with the proper interconnecting cable, it would make a new moble installation much easier. Thanks for reading this post.

Yes, and additionally, I recommend you look at
http://www.tigertronics.com for their little SignaLink interface box.
Its about half the price of other interface boxes and works well on an
Echolink node.

AEA is out of business. Timewave Technology purchased the data
controller products. Tempo purchased the antenna analyzer products.
Most of AEA other products died when they went out of business a few
years ago. Seems to me about 1998. It would not hurt to check with
Timewave at www.timewave.com to see if they are or know of someone who
repairs the AEA keyer line.

Howdy Kirk.....Hope this doesn't sound too obvious but have you tried any rudimentary troubleshooting yet? Though I don't know your particular keyer, I'd suggest opening it up and either running it or letting it stay powered up while testing to see if it works the same or is now ok or better (air circulation to confirm heat related)....during this time observe components (touch or temp probe with your meter etc) for excessive or isolated warming (one component or one area etc). Once the problem occurs, if warming (a ballpark would be parts getting uncomfortable to touch) is observed, try hitting them with a jet of freeze spray (or even cool compressed air) to see if the problem changes. Check basic power supply voltages (look for a regulator chip to get the value and/or check the basic specs of various chips or the one keyer chip for its intended operating voltage). One specific thing that comes to mind is that some keyer circuits utilize diode logic switching at the paddles (diodes might be elsewhere though) and in particular sometimes a diode is across the paddles......it "might" be that if this was failing you could get the symptom you described. This basic troubleshooting can be done without schematics if a little care and common ham-knowledge sense is used so..........have fun.......let us know what ya found.

From: Fran&#65533;ois Guillet <MyAddressIs-guillet.francois@wanadoo.fr>
Message-ID: <3f9aa31f$0$27014$626a54ce@news.free.fr>
Source record: 25800

I'm looking for a hand-held dual band portable (144-148, 430-450) with 6.25 Khz channel step for compatibility reason with the european PMR (private mobile radio, 446 Mhz).

I can't find the channel steps of the following equipements in the online specifications:
Kenwood TH-G71A, TH-F6A, TH-7AG
Icom IC-T90A
Alinco DJ-596T, DJ-V51TH

Could the owners of such TRX let me know if 6.25 Khz step is including or not? Any other suggestions are welcome.

Thanks, 73!

A Kenwood TS-440 or 450 could meet all your objectives. You will need to get one with a CW filter. I have seen them for $400-500. I had a TS-440 for 10 years or so, then upgraded to the 450.

If you can figure the number and size of the individual cells within
the battery, you might be able to rebuild with that case.

Alternately, there are several outfits which sell replacement packs or
rebuild older battery packs.

Happy trails,

Message-ID: <f_cnb.16735$5c2.6972@okepread03>
Source record: 25819

I have for sale a Kenwood TS-930SAT. It is in nice cosmetic condition. It has a few small scratches and dings, but looks very good. It works. However, it does have some problems. When first turned on, everything works great. Full output,
ALC works as it should, digital readout is clear. Receiver sounds great. However, when it warms up for 10 or 15 minutes, the digits on the frequency readout stay clear and bright, but all of the other information on the readout,e.g., indicators for VFO A or B, RIT, etc. fade out.
Also, the ALC goes wild, pegging the ALC meter in transmit and cutting back the power. I have to turn the mic gain up high to get power out. Otherwise it continues to work fine. I am selling it as a fixer upper for $375. I will make a good transceiver for someone with some technical skills. Thanks,
Charlie Hugg, K5MBX

4005. Ford 2003 Explorer, possible PROBLEM for Lowbanders... Please read, pass along to other Explorer owners!

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-28 15:21:07 UTC
From: Frank Krozel <frank@electronicinstrument.com>
Message-ID: <DPvnb.5281$Px2.923@newsread4.news.pas.earthlink.net>
Source record: 25829

Hi guys,
I was just at my dealer.., had a problem with the rear optional climate control motor....
I placed the low band ball mount on the drivers side of the vehicle, near the back hatch...
(Actually it is almost in the same area as the gas door, only the ball mount is on the driver's side.)
On my vehicle, it has the upgraded rear fan / climate control, which has it's controls in the front ceiling, near the mirror.
The actual fan is near my ball mount, drivers side, rear.
In any event, I drilled the hole exactly where the last one was on my 98 Explorer, and then attached a rather healthy 1" ground strap, and ran that to my LDG...
In addition, I then placed the coax on the mount, and did my usual 8 turns of RG-8U for the current balun.
Then, bundled both with tape and ran the coax and ground strap to the tuner.
Along the way... the ground strap touched the outer part (the case in other words) of the fan motor, which ,,,, I assumed was at GROUND POTENTIAL, well guess what, it is NOT at GROUND POTENTIAL! It is at POSITIVE POTENTIAL. Go figure. Got LARGE SPARKS!, and burned out some sort of resistor that regulates this rear fan..
In any event, it blew the resistor on the motor, a minor part to replace.
So, don't assume that cases of motor's are at ground potential.
See you on 40 & 20 SSB & CW.

4017. Measuring Velocity Factor w/ MFJ-259

Newsgroup: rec.radio.amateur.equipment
Date: 2003-10-30 04:38:34 UTC
From: Jason Dugas <kb5urq@hotmail.com>
Message-ID: <vq15emev53rvc8@corp.supernews.com>
Source record: 25840
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

I'm interested in measuring the velocity factor of some coax I have (more of an exercise than necessity). In order to do this, the MFJ-259 Operations manual states that the "stub" to be measured should be attached with a 50-ohm noninductive resistor in series to that center conductor of the Antenna connector on the analyzer.

What would be a good way of making this connection? I've thought about it quite a bit; the best idea I've come up with so far is to have a small metal enclosure w/ two SO-239's mounted. The resistor would go from center conductor to center conductor of each SO-239. But this requires too many extra connections & lengths. Is there a better way to do this? Would love to see anyone else's experimental setup, particularly if there are pictures or details on the web.

Thanks & 73,

Jason

Source record: 25841

Hi everybody,

we are currently considering to buy one of these two wideband receivers. This is why I wanted to ask, if you can provide me some input that helps me to make the right choice.

Our Application requires:

- RS232 Interface: We need to control the receiver via our own software running on a PC. Are the command lists of both receivers public? Is one software interface better (easier to handle) than the other?

- A 10.7MHz ZF ouput signal: We will mainly use the ZF output of the receiver and then do our own signal processing. Both receivers seem to provide a bandwidth of +/-5MHz, right?

- Filtering the ZF output signal: We would like to have the option to filter the 10.7MHz output signal. It seems with the AOR receiver it is possible to provide the following bandwidths on the ZF output: 3kHz, 6kHz, 15kHz, 30kHz, 110kHz and 10MHz (no filter) - is this correct?

Does the ICOM receiver allow similar filtering or does it even provide more options?

It is important for us that there is an option to filter the ZF output. Are all filters available for all frequencies (both receivers)?

- Sensitivity: The IC-8500 seems to have the better sensitivity than the AOR 8500. Is there a significant difference in practice?

- General: Is there anything paritcular good/bad we should know about the receivers?

Thanks for your inputs,

Stefan

==========
Since no power is involved the non-inductive resistor can be very small .
If accuracy is a point ,get a 50 Ohms , 1% metal film resistor or select a
near 50 Ohms resistor from a batch of standard 5% resistors with an accurate
Ohm meter .
Cut the leads as short as possible but adequate for insertion and soldering
into the SO 239 coaxial socket.
You now know the minimum distance between de 2 SO 239 sockets and can make a
suitable enclosure from bits of scrap plain printed circuit board (in
Europe available at amateur radio fleamarkets and often sold by the
kilogramme)
With the enclosure completed and holes drilled for the SO 239 connectors
,fit one connector with the resistor soldered and subsequently fit the other
connector and solder it to the resistor.
The result is a resistor in between the 2 SO 239 connectors with hardly any
wire visible.
Finally finish the enclosure by soldering a cover of the same PCB material
or keep the cover removable by means of soldered nuts inside the enclosure
and matching screws.

Message-ID: <pan.2003.10.30.16.13.46.429340@fake.invalid>
Source record: 25843

The 10.7 MHz IF output on the IC-R8500 above
30 MHz is about 10 MHz
wide, though not necessarily within 3 db.
The 10.7 MHz bandwidth is much more narrow below 30 MHz.

The IF output is taken before the IF filtering and you cannot
adjust the IF output bandwidth.

The IC-R8500 computer commands are documented in the
user manual and I used them to write tk8500 open source software
(see http://parnass.com)

Message-ID: <3FA144CA.5030109@value.net>
Source record: 25845

For Sale Mint (less that 2 months old) Icom W32A Dual
Band 2 Meter/440 HT
Comes with the new box, stock 9.6 Volt/600 mH-a
Battery and wall wart charger.
In addition to the above it includes the following:
4-cell Battery case (Icom BP-170)
6-cell Battery case (Batteries America BP-170L)
a "Pouch" (Pouch 32-5T)
Speaker-Mic (ADI/Prime, I think) fits perfectly.
Also I made a programming cable with all the circuitry
mounted in the 9-pin sub D connector. Will throw that
in and the software to program the radio.
The MARS/CAP mod is done....No other mods!
All above is new - less that 2 months except the Mic.
Over $350.00 not including the tax I paid.
$275.00 Firm.

Kenwood TM-G707A duo-band mobile for sale. Looks good, not beat up in any
way.
Comes with touch-tone microphone, and working control head.
(I tried the head out a few months ago at a local ham's house and the head
works...)
Rear end has some sort of problem, but I don't have time to try to fix it..
Sold as - is, with no claim of it working, or I am in for a possible trade.
Don't have time to fix so it may be yours if the trade or price is right.
Best Regards, Frank

Source record: 25847

The radio has an RS232 interface built in, no adaptor required and the Command set for CI-V is published and available for download.

I got to play with three ICR-8500's for a special project I was working on. The construction is beautiful. We were using as a logging receiver with some custom software written in "C". One thing we noted was that we needed a fast unsquelch indicate for our application. Unlike the R7000 receiver, the record indicate relay closure is very slow as it is software derived. I was able to delve into the audio squelch circuitry and pull out a fast unsquelch signal which we buffered with an optical iso coupler. Since you are apparently doing outboard demodulation this may not be relevent to you.

By the way, unlike the R9000 receiver this radio is supposedly to market with, the construction is almost entirely SMD, so you will need to be very cautious in making modifictions. Finding a via hole to connect a wire to was the safest way to bring out the signals we needed.

You can probably get a service manual on-line or buy from ICOM. I would get the documentation for both radios first before making your choice.

Joe

And this comes from someone who I could swear posted not long ago a
table that had velocity factors for solid polyethylene cable that were
significantly different from this magic number?

But even if we just limit ourselves to HF and above, there's a
problem: most "solid poly" cable I've encountered has small gas
bubbles in the dielectric, and the v.f. does not measure exactly
0.665. Most of the time, the difference doesn't matter, but sometimes
it does, and then it's not safe to assume it's 0.665. And of course a
lot of cable these days uses foam dielectric, which can be noticably
different from batch to batch.

==========

Your para. 1. You can swear till you're appoplectic black and blue in the face - it wasn't me. I'm not THAT stupid. So who was it then?

Your para. 2. If there are little bubbles in it, it is not solid. If it is foamed, it is not solid.

Just to add a little more useless information, did you know the stuff also varies with pressure and temperature as at the bottoms of the oceans? Also, under pressure, water disassociates and hydrogen slowly diffuses through it. Rodents seem to take a fancy to it.

Velocity factor = (Permittivity)^(- 1/2). Permittivity of polyethylene = 2.26 but it does vary slighty from one book to the next.

Reg.

Mine doesn't have a noise blanker. It just has a button that says
noise blanker. I use an AmCom clear speech speaker which solves the
problem.

Alan, IC796 must have been a typo, hit the nine key instead of the zero,
I do that sometimes too. Your's is the only one that seems to be working

I take it then the noise blanker is not too good in most of the 706
series.

I wonder how the FT-857 is?

My FT-900 is quite good, but I don't think I can get it in my new
vehicle.

Thanks

Dale,
The noise blanker on my 706IIG works well on the ignition noise from
my Cherokee sport. I run the power lead directly to the battery,
while keeping it as far away as possible from any other wiring.

It will soon be in a Chevy 1500 pickup. I would think it will do
well there too.

Will this filter fit an Icom 725?
The manual only mentions FL-100 and FL-101

Thanks.... Gil

4066. FS: Manual for Racal RA6790GM

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-01 13:37:53 UTC
From: AL KA5JGV <ABurzynski@nojunk.satx.rr.com>
Message-ID: <RGOob.15536$qo4.12262@twister.austin.rr.com>
Source record: 25789

For Sale:
Technical Manual TM RA6790/GM-3 for Racal HF Receiver type RA6790/GM-3 dated December 1991. This is an original manual, not a photo copy. Manual is in very good condition, no pages missing (that I am aware of) with occasional pencil tic marks on some of the schematics. It's yours for $10US with free shipping in US.

If interested contact me at:

ABurzynski at satx dot rr dot com

In VK, the Holden Commodore is powered by a Buick 3.6 ltr V 6.. the computer
and electrics in 2000 yr on model Holdens will not allow use a 146.800
Repeater out put on the 2mtr section using a 706MK 2G.. amazing, thats how i
ended up with this new G, i installed it in a '94 Commodore same motor
earlier PC and Electrics, works ok, but the Internal HASH noise of the 706
doesn't help the cause , but the GAP HEAT IT spkr does,
Injector Primer Pumps cause some bother also, I run a Hi Sierra S/DRIVER
mounted on the Trailer hitch away from the PC , antenna is grounded at the
base hitch plus to Exhaust pipe and again at the engine end i have bonded
the donk to the chasis , and I take the DC off the starter and run it to to
Netural Links in the boot via 400amp Cable
then each rig (remoted in boot) have their own ferrite DC filters, a lot
more work getting HF mobile in these new rigs

I've had one in my truck since 1999 (706, MKII & MKIIG). With what little ignition noise I have. It's very effective. It does not help with fuel pump noise. The other gentleman is right about the 756Pro.

4080. Wanted: 23cms preamp and linear amplifier

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-01 16:31:38 UTC
From: Al Bolton <al.bolton@ntlworld.com>
Message-ID: <KdRob.743$u9.705@newsfep1-gui.server.ntli.net>
Source record: 25703
Cross-posted to: uk.radio.amateur,rec.radio.amateur.equipment,rec.radio.amateur.antenna,rec.radio.amateur.homebrew

Wanted: A 23cms preamplifier, prefer an RF switched type. Well made home brew example is fine, so long as it works properly!

Also wanted: A linear amplifier for 23cms, approximately 1.5 Watts input, minimum of 15 Watts output required. Again, good home brew example is fine.

Can collect (located near Reading, Berkshire,U.K.) or will pay postage. I have a PayPal account available to speed things up.

Please e-mail me if you can help.

Thanks,
Al, G4VSQ

Interesting comments on the 706 noise blanker.

I already have a LDG tuner also and that's one of the reasons I would
like to give the 706 a go. Interested in hearing any comment too about
using the 706 and LDG tuner.

My 706 NB works just fine. But I have a 2003 Ford e-150 cargo van with the coil-over-plug ignition, so there's little noise to deal with anyhow. (it worked fine on other vehicles too)

Of course, if you don't see "NB" at the far left of the SWR/Power scale, the noise blanker is turned off...

You may think it says this:
MFJ-resistor-coax_center_conductor--
|
---------coax_shield------------

But maybe it means this:

MFJ----------------coax_center_conductor-resistor-
|
----------------coax_shield--------------------

I don't know what the MFJ documentation says - but if
they want a 50 ohm resistor in series from the center
conductor and the shield, put it at the far end of the
length of coax you are testing. Connect it as shown in
the bottom diagram by soldering the resistor directly
across the center conductor and shield at the far end.

The way I do it is to cut a physical 1/2 wavelength
coax for the frequency, install a pl259 on one end and
connect it to the MFJ. I install a 51 ohm resistor at
the far end of the coax. When that resistor is 1/2
wave away *electrically*, it's impedance will appear
across the PL259 plugged into the MFJ. You need to
shorten the coax by snipping off some of the length
at the far end, then reinstalling the resistor.
When you have the thing at an electrical 1/2 wave
you'll get Z=50 at the MFJ. Your VF is the length
of that piece of coax divides by the original length.

Maybe the MFJ documents a better way - I dunno - but
I've used my way successfully.

I have the following items for sale. Prices do not include shipping. I
will ship overseas.

Swan WM-2000 Wattmeter.....$75 plus shipping
This meter covers 3.5 to 30 MHz and measures SWR and power. Power is
measured in 2 ranges: 0-200 watts and 0-2000 watts.
This unit is in excellent condition and works well.
http://members.cox.net/radiostuff9/swan_wm2000.jpg
http://members.cox.net/radiostuff9/swan_wm20003.jpg

Kenwood MC-80 Microphone.....$75 plus shipping
This remote tune mike is for use with radios such as the Kenwood
TS-440S,
TS-430S and possibly some other Kenwood radios. The mike is in nice
shape and works well.
http://members.cox.net/radiostuff9/kenwoodmc80.jpg

Sonar LP Filter - NIB E.F. Johnson Clone.....$50 plus shipping
This looks like a clone of the EF Johnson low pass filter however it has
a neat chrome finish.
This is new in the box with instructions and mounting brackets. This is
a 52 ohm filter that
will handle 1 KW from 2-30 MHz.
http://members.cox.net/radiostuff9/sonar_lp_filter.jpg

E.F. Johnson Antenna Meter/SWR Bridge.....$25 plus shipping
This is a miniature SWR bridge with a max power level of 500 watts. I
found a picture of this unit in an ad in a 1965 QST. The unit has been
tested and works great.
http://members.cox.net/radiostuff9/efj_swr.jpg

Heathkit HS-24 Mobile Speaker.....$35 plus shipping
This is the speaker that Heathkit intended for use with the HW-12, HW-22
and
HW-32 series of monoband transceivers. This speaker works well and is in
excellent condition with no
extra holes. The holes on the sides were factory drilled for the mobile
mounting bracket.
http://members.cox.net/radiostuff9/heath_hs24.jpg
http://members.cox.net/radiostuff9/heath_hs242.jpg

Heathkit QF-1 Q-Multiplier- Original Manual.....$50 plus shipping
An exceptionally clean unit with the original manual.
http://members.cox.net/radiostuff9/heath_qf1.jpg
http://members.cox.net/radiostuff9/heath_qf12.jpg

http://members.cox.net/radiostuff9/heath_qf13.jpg

National Type MCN Vernier Dial - NIB!.....$45 plus shipping
http://members.cox.net/radiostuff9/mcn.jpg
http://members.cox.net/radiostuff9/mcn2.jpg

Metrotek Mustang Vintage 1960's Tube CB Radio.....$80 plus shipping
Easy conversion to 10 meter AM. This is a 7 Tube Transceiver from the mid 1960's. It has a tunable receiver and 6 crystal
controlled channels for transmit and receive. This will work on 110 and 12 volts. The radio works great on
transmit and receive. it currently has one channel crystalled up. The power cord included is for 110 volts. It has the original factory microphone. The inside is clean and unmodified with no signs of abuse or burned components. It also includes the factory mobile bracket which is not shown.
http://members.cox.net/radiostuff9/Mustangcb.jpg
http://members.cox.net/radiostuff9/Mustangcb3.jpg

Gonset Communicator III - 6 Meters.....$80 plus shipping
This is a separate receiver and and crystal controlled transmitter from the 1950's . The unit has been tested and works. Includes a bunch of crystals. The radio has a number of scratches.
http://members.cox.net/radiostuff9/gonset_comIII_6m.jpg
http://members.cox.net/radiostuff9/gonset_comIII_6m2.jpg

Heathkit FM-3A Tuner and WA-P2 Pre-Amp.....$35 plus shipping
The FM-3 is a 7 tube FM tuner introduced in 1958. I have no info on the pre-amp but based on the styling I would guess it to also be from around 1958. The tuner has been tested and works great. The pre-amp has no internal power supply so it is untested. I believe it is meant to take it's power from one of the Heathkit amplifiers of the same vintage.
http://members.cox.net/radiostuff9/oldheathstereo.jpg
http://members.cox.net/radiostuff9/oldheathstereo2.jpg

Eimac 4-125 Transmitting Tube and Socket.....$65 plus shipping
The tube appears new. I checked the filament for continuity which it has. The brown color
in the glass is a reflection off of the beige background. The socket is used.
http://members.cox.net/radiostuff9/4-125.jpg

Thanks for looking

How does the 259 differ from the 259B? Does the 259 have a distance
to fault mode?

I ask because the instructions for the 'B say that coax lines must be
open or *shorted*. Anything in between is verbotten.

With the 'B you use the "distance to fault" mode to figure
out the electrical length of the line then devide by the
physical length to caluclate the velocity factor.

Source record: 25728

I have for sale in excellent cosmetic condition a Kenwood TS-930S/AT. It comes with the original inner and outer boxes, instruction and service manual. There are no optional filters installed and no microphone. On a scale of 1 to 10 its a 9 from a non-smoker. There is one glitch the internal atnenna tuner will search, but will not find a low swr. So it may need an adjutment of some sort. I will take $450 for it plus shipping. If you need any digital pictures let me know and I can send you some if needed. I can be reached at (508) 821-2993 or email. WZ1U Steve / Lakeville, Ma.

The MFJ-259 does not have a "distance to fault" mode. It has an "SWR" meter
and a "Resistance" meter.

It's quite accurate figure, but the cables are not so accurate.
Remember trying to make two RG213/U halfwave stubs for 100MHz, and was
surprised to learn that the 'halfwave' length varied about an inch

Suppose it wasn't only for the bubbles...

Do you have a scope and a pulse generator? If so, just make a simple
TDR (Time Domain Reflectometry) setup to measure the reflection from a
un-terminated or shorted far end of the cable. You will get much more
accurate results with substantially less effort.

Don't get me wrong, the MFJ-259 is a good instrument. It's just that TDR
is so quick and easy and unambiguous for propogation delay measurements.

Tim.

I've had an MP for 4-5 years. Works great. I have installed the INRAD mod plus a few INRAD filters. Otherwise the radio is stock. However, on 15M the receiver does not seem as hot as on other bands. If 15M is open, I can hear plenty of signals (and they will go to S9 or better), but on a dead band there is just not that much background noise. Jumping to any other band (which may or may not be open) the background noise level is higher. I have noticed this on certain out-of-band segments when SWL to foreign broadcast, utilities, etc.

Does anyone have experience with this? Quirk of the MP? Full receiver alignment? 15M segment alignment? Forget about it?

Thanks and 73

Somehow, I'm guessing you'll have a lot better luck with an antenna
that's properly set up for the low bands, with the tuner bringing in
the high bands, than trying the inverse, where the tuner would be
trying to replace the big loading coils & radials for the low bands.
Might burn out the tuner.

Hi Reg...

Well, the Google archive says it was from you. Perhaps you DO have
someone else posting under your name.

See below. Or is the "VF" column not actually velocity factor? OTOH,
I do agree with the posting below, that at low frequencies, beta
becomes dependent more on R than on L, and thus the VF changes.

Cheers,
Tom

From: Reg Edwards (g4fgq.regp@btinternet.com)
Subject: Coax Cable vs Freqency

View this article only
Newsgroups: rec.radio.amateur.antenna
Date: 2003-08-12 17:41:24 PST

For anyone who may be interested.

Typical of RG-58 and RG-11 type cables.
Zo = Ro - jXo
Xo is always negative.
Angle of Zo in degrees. Always negative.

VF = relative velocity.

Freq	Ro	jXo	Angle	VF
50 Hz	967	-965	-44.95	0.034
1 kHz	220	-213	-44	0.151
10 kHz	80	-58	-36	0.41
100 kHz	56	-9.3	-9.5	0.59
1 MHz	52.4	-2.4	-2.7	0.63
10 MHz	50.7	-0.76	-0.86	0.65
100 MHz	50.2	-0.23	-0.27	0.66

Smith Chart calculations begin to be inaccurate around 2 MHz and
below. So
do SWR meters.

Even if you just ignore the fact that at low frequencies, R dominates over omega*L and affects the velocity factor, even if you just say VF=c/sqrt(LC), I believe there are changes with frequency. That's because with a good dielectric like polyethylene, C doesn't change much with frequency (AFAIK), but L decreases as the skin depth decreases. On large line, it's unlikely to be noticable, but on a line with an inner conductor radius only a few skin depths at the low end of HF, the change can be perceptable. Of course, the R term does dominate over omega*L at low frequencies. If the velocity factor were independent of frequency, I'd expect no dispersion.

BTW, I'd be a little surprised to find an inexpensive line which did not have polyethylene dielectric...polyethylene isn't expensive, and it's a good dielectric except for its low softening/melting temperature. You should be able to get a pretty good idea what it is from carefully measured VF, if it's a solid dielectric. There are very few inexpensive and low-loss plastics with as low a relative dielectric constant as polyethylene.

Cheers,
Tom

Tom,

It should be obvious when somebody asks how to find VF by using an HF antenna analiser he is interested, like every other radio amateur, in the HF value of VF.

If you agree with the table in the other posting, which gives VF vesus frequency, and you are aware VF decreases with frequency, then how come you didn't realise you had taken the value of 0.665 out of its HF context.

All my figures are correct.

Reg

Hi you will see that time to time on 15mtrs, more so now cylce is going, you
can check the Hidden menu options in regards the Amp Gain becuase sometimes
you may have to drop the gain in the menu after the INARD Noise Floor mod,
but normally i would say 'don't worry about it, 15 is like that

So, Reg, I note that (1) YOUR table shows more variation in VF over
the HF ham bands (especially so if you allow it to be extended down to
the 1.8MHz ham band, which I assume the MFJ analyzer would cover) than
the three significant digits of 0.665 would allow (the table showing
only 0.65 at 10MHz, and I suppose you'd go for about 0.64 at 2MHz,
maybe even 3.5MHz), (2) your posting in this thread of 0.665 did NOT
qualify the VF as being HF only, and (3) my posting DID say something
that SHOULD have indicated to you and anyone else who read it that I
was thinking beyond the bounds of HF with respect to large VF
variation. I'd STILL say there are instances where one should not
assume 0.665 for solid polyethylene at HF. There are instances where
0.64 and 0.665 are different enough to want to get the right value.
You're welcome to get all bent out of shape over that if you wish.

Cheers,
Tom

Outside of the States?

Whatever hamfest (ham radio swap meets) are local to you.

Alternatively, you could contact Motorola directly. I'm sure they
have an office in your part of the world.

Yes, Ed is correct, it is the type of mount that Antenna Specialists uses.
Here is a link to some of their mounts, including the style you have:
http://www.antennaspecialists.com/lm_cat/lmrpg37.html Look at the K-49
and K-57
What it is, is a modified PL-259/SO-239 design, where the male and female
portions of the center connector have been swapped. In fact, looking
further on the website, I see where they are now selling a replacement solid
center pin, so the antennas can be mounted on a standard SO-239 mount.
These used to be very popular with Public Safety, gray coils about 7/8" in
diameter. I have no idea what brand of antenna you have, though.

Hi Group

We are building an autonomous Relay-Station for PBR using the Dataradio RNet-JSLM Transceiver.

The Application this unit is intended to be used in has some sort of remote control functionality, whereas the frequency of some control tones is as low as 123Hz. We need to transmit these tones transparently through a system consisting of two of the mentioned untis without any loss of NF power. We noticed while using the Tx-/Rx-Auxiliary Data Path that there must be some high pass filter applied, which prevents from getting these low control tones
through the system.

Does anyone know if NF Frequency response of these Modules can be tuned in order to pass our control tones ?

Thanks in advance

Gian

Leading eventually to the suggestion that perhaps your MFJ analyzer
isn't worth the powder to blow it up...

But I submit that you can make VF measurements on your cable with it,
which may be limited by the accuracy with which you can measure the
length of line you are looking at and not by the fact that you're
using a relatively inexpensive instrument. Here's one way. If you
look at a shorted stub 90 electrical degrees long in parallel with a
50 ohm resistor, you'll have to move the frequency by some value to
resolve a difference. The amount you have to move the frequency
probably determines the resolution you can get in VF. But if you make
the line 270 degrees long, you'll have three times the sensitivity.
So a hundred foot length of line, measured near 10 meters frequency,
would be long enough to get very good resolution--it'd be on the order
of 1530 electrical degrees. I'd be surprised if you had trouble
seeing the difference between, say, 0.664 and 0.665 VF. But beware
that the VF _does_ change with frequency, even over HF. There are
times when _I_ care about that, even if some others don't.

Cheers,
Tom

Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio

Follow the directions below and in two weeks you'll have up to
$20000.00 in your PayPal account. There is a very high rate of
participation in the program because of its low investment and high
rate of return. Just $5.00 to one person!

THAT'S ALL !!!

If you are a skeptic and don't think the program will work, I urge
you to give it a try anyway! It REALLY WORKS! Why do you
think so many people are promoting it ?

LOOK AT IT THIS WAY: If the Program is a total failure for you and you
never get even $1.00 in return, your total loss will
be the $5.00! If you are not yet a paypal member, there is no risk at
all!!! If the Program is only moderately successful for
you, your PayPal account will have several hundred dollars deposited
into it within the next few days! If you actively
participate in the Program, you could have up to $20,000.00 in your
PayPal account within two weeks!

Now let me tell you the simple details.

Getting Started!!

If you're not already a user of PayPal, the very first thing you need
to do is go to PayPal and sign up. It takes two minutes
and Pay Pal will deposit $5.00 in your account just for becoming a
member. That makes this program's total cost $0!!! Follow
this link to open your PayPal account:

https://www.paypal.com

Now log into your PayPal account, and send the PayPal account of the
person listed in Position 1 $5.00 PayPal will ask you to
select type. (Select "service" and put "$5.00 donation" for
subject.) When person in Position 1 receives notification of your
payment, you can simply copy this page and change the names in
position #1 & #2 & #3 as instructed. Remember, only the person
in Position 1 on the list gets your $5.00 donation. Send them a
donation then remove #1 PayPal account from the list. Move the
other two accounts up & add your Paypal account to #3 position. After
you have retyped the names in the new order,

IMMEDIATELY send the revised message to as many people as possible.
PROMOTE! PROMOTE! The more you promote the Program, the
more you will receive in donations!! That's all there is to it.
You are reading this message in usenet, and usenet is the best way
to spread the word about the program. Post this message to AT LEAST
200 groups in usenet(there are over 20, 000), after you send the 5
dollars to the person at #1. This will guarentee you a profit from
this program. The more groups you post it to, the more money you will
make!!!

When your name reaches Position 1 (usually in less than a week) it
will be your turn to receive the cash. $5.00 will be sent
to your PayPal account by people just like you who are willing to send
$5.00 dontation and receive up to $20,000 in less than
two weeks. Because there are only (3) names on the list you can
anticipate 80% of your cash within two weeks.

Anytime you find yourself short on cash just take out your $5.00
donation program and send it to 50 prospects. Imagine if you
sent it to 100 or even more. Most people spend more than $5 on the
lottery every week with no real hope of ever winning.

IMPORTANT!!! IN ORDER FOR THIS PROGRAM TO WORK, YOU MUST BE HONEST. DO
NOT ADD YOUR EMAIL IMMEDIATELY TO THE #1 POSITION, AND MAKE SURE TO
SEND YOUR 5 DOLLARS TO THE PERSON AT #1. IF EVERYONE WHO TRIED THIS
DIDN"T SEND THE MONEY, THEN NOBODY WOULD MAKE A DIME. 5 DOLLARS IS A
VERY SMALL INVESTMENT, ESPECIALLY WHEN YOUR ABOUT TO MAKE MANY MANY
MANY
TIMES THAT AMOUNT. IF WE ARE ALL HONEST, THEN WE ALL MAKE LOTS OF
MONEY!!

REMEMBER, you add your email to the #3 spot, and then move everyone
else
up 1(deleting the person who was formally in the #1 spot, and who you
should have sent your money to). DO NOT add your email to #1 when you
start this program. If everyone did this, then NO ONE would make a
cent.

THIS PROGRAM WORKS - JUST TRY IT

POSITION # 1 PAYPAL Account: lamsmo@aol.com

POSITION # 2 PAYPAL ACCOUNT: pepsiholic44@aol.com

POSITION # 3 PAYPAL ACCOUNT: bunnylovemedo@yahoo.com

Integrity and honesty make this plan work.
Participants who actively promote this program will average between
$8000
and
$12000 and receive the donations within two weeks.

This is not a chain letter. You are simply making a donation of $5.00
to another person. The Program does not violate title

18 section 1302 of the Postal and lottery code.

Remember -TIME is of the essence. YOU can choose to live Paycheck-to-Paycheck or live FREE from FINANCIAL BONDAGE. Become a part of the donation program and help people help people.

This program is about helping each other!

Success is a journey - Not a destination!

Start Your Journey TODAY!!!!

Hi Gang,
Looking for an AEA MBA Reader (RTTY, CW decoder/display).
If anyone has one they're not using fairly cheap, I'd like to hear
from you.

Steve W6SSP

I have the following items for sale. Prices do not include shipping. I
will ship overseas.

Sprague TO-4 Tel-Ohmike Capacitor Checker and Manual...$125 plus
shipping
This is a deluxe tester that will measure capacitance, power factor,
leakage current, insulation resistance and resistance. It will measure
capacitance from 1 pf to 100 mmf and resistance up to 20,000 Megohms.
This unit works well and is in excellent condition. This is an
exceptionally clean unit and the front panel shines like a new. Includes
a copy of the manual.
http://members.cox.net/radiostuff9/sprague_to4.jpg

Swan WM-2000 Wattmeter.....$75 plus shipping
This meter covers 3.5 to 30 MHz and measures SWR and power. Power is
measured in 2 ranges: 0-200 watts and 0-2000 watts.
This unit is in excellent condition and works well.
http://members.cox.net/radiostuff9/swan_wm2000.jpg
http://members.cox.net/radiostuff9/swan_wm20003.jpg

Kenwood MC-80 Microphone.....$75 plus shipping
This remote tune mike is for use with radios such as the Kenwood
TS-440S, TS-430S and possibly some other Kenwood radios.
The mike is in nice shape and works well.
http://members.cox.net/radiostuff9/kenwoodmc80.jpg

Sonar LP Filter - NIB E.F. Johnson Clone.....$45 plus shipping
This looks like a clone of the EF Johnson low pass filter however it has

a neat chrome finish. This is new in the box with instructions and
mounting brackets. This is a 52 ohm filter that will handle 1 KW from
2-30 MHz.
http://members.cox.net/radiostuff9/sonar_lp_filter.jpg

Heathkit QF-1 Q-Multiplier- Original Manual.....$50 plus shipping
An exceptionally clean unit with the original manual.
http://members.cox.net/radiostuff9/heath_qf1.jpg
http://members.cox.net/radiostuff9/heath_qf12.jpg
http://members.cox.net/radiostuff9/heath_qf13.jpg

National Type MCN Vernier Dial - New in Box!.....$45 plus shipping

http://members.cox.net/radiostuff9/mcn.jpg
http://members.cox.net/radiostuff9/mcn2.jpg

Metrotek Mustang Vintage 1960's Tube CB Radio.....$80 plus
shipping
Easy conversion to 10 meter AM. This is a 7 Tube Transceiver from the
mid 1960's. It has a tunable receiver and 6 crystal controlled channels
for transmit and receive. This will work on 110 and 12 volts. The radio
works great on transmit and receive. it currently has one channel
crystalled up. The power cord included is for 110 volts. It has the
original factory microphone. The inside is clean and unmodified with no
signs of abuse or burned components. It also includes the factory mobile
bracket which is not shown.
http://members.cox.net/radiostuff9/Mustangcb.jpg
http://members.cox.net/radiostuff9/Mustangcb3.jpg

Gonset Communicator III - 6 Meters.....$75 plus shipping
This is a separate receiver and and crystal controlled transmitter from
the 1950's . Unit works but needs dial cord restrung on receiver.
Includes a bunch of crystals. The radio has a number of scratches.
http://members.cox.net/radiostuff9/gonset_comIII_6m.jpg
http://members.cox.net/radiostuff9/gonset_comIII_6m2.jpg

Gonset Communicator III -2 meters.....$75 plus shipping
This is a separate receiver and and crystal controlled transmitter which
I believe is from the 1950's. Receiver works, transmitter is untested as
I donï¿½t have the right crystals. It does have a number of scratches.
http://members.cox.net/radiostuff9/gonset_com3.jpg
http://members.cox.net/radiostuff9/gonset_com32.jpg
http://members.cox.net/radiostuff9/gonset_com33.jpg

Eimac 4-125 Transmitting Tube and Socket.....$65 plus shipping
The tube appears new. I checked the filament for continuity which it
has. The brown color in the glass is a reflection off of the beige
background. The socket is
used.

Check out http://eham.net and click on "product reviews" for reviews of all those rigs.

I've personally owned the FT-1500 and it's a fantastic rig. I only got rid of it because I need something with a remote head. Unfortunately there are no 2m monoband radios with remote heads!

Message-ID: <jjvqb.12656$Oo4.2839@newsread1.news.atl.earthlink.net>
Source record: 25695

SX-110 is a good receiver. However its design, (1950s) is somewhat lacking by todays standars.

For a general coverage AM shortwave receiver, it will do the trick. For general AM and maybe CW work it will do.

I have one and I much prefere the SX-111, 101a, 115 etc for ham band usage.

I'm very pleased with my two Kenwood TM-261A's (one permanently
installed in the mobile shack, and the other in the home shack).
I bought both of them new several years ago, and they've given
me trouble-free, dependable service. The receiver performance
is outstanding. It's virtually impervious to intermod, even here
in "Intermod City, USA" (better known as Dallas). Even after
soaking in the blistering Dallas heat day after day for many
summers, I've had no problems with the rig. It even survived
a horrendous collision that nearly totaled the vehicle it was
installed in at that time. For the cost, the TM-261A is hard
to beat. I have no plans to ever replace them!

Source record: 25600
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.equipment

Hmmm, I would have sworn the manual covers this, or is that just on the B model?....

I'll have to try this, but how about just connecting a length of coax, open at the other end and looking for the min Z. The longer it is, the less effect of any "end effect".

TO get around end effect, go to the shorted stub method...but...
I don't understand the 50 ohm in parallel. I'd put some large R in parallel when trying the shorted-end method such that there will be a reading. If I recall, mine stops above 1500 ohms. So, I'd put, say, 1 K in parallel then find the two freqs where I see some specific value lower than the resistor alone, then take the geometric mean for the stub's resonant freq.

Hi,

I have owned the IC-2100H for about 18 months and I am very happy with it. I regularly get great audio reports. Tx performance with a 1/4 wave mobile whip has been impressive on simplex and distant repeaters. The 113 memories and other functions are computer programmable. The display is alpha-numeric so you don't need to try and memorize which freq's belong to which repeater. IMD figures are great and it comes with a DTMF mic. It also has expanded receive coverage for monitoring public service, etc.

Hello Bob .... I have been able to hard solder small pieces together quite well. I am no master craftsman either. Just make sure that you clamp the pieces together properly with tiny and I do mean tiny pieces of solder in the joint space of the break. Use the right flux ...very important and practice with a test piece before. You can get sets with flux and silver solder for a few bucks. Good luck

4187. updated Allied SX-190 AX-190 SW receiver info

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-07 03:26:40 UTC
From: Mark Rehorst <rehorstmark@netscape.net>
Message-ID: <o54mqv4ucfuqtm943s79084t1iel3o7o9p@4ax.com>
Source record: 25610

You can download a ton of Allied SX/AX-190 receiver information
in a single, 2.0 MB .rar archive file here:

http://www.rehorst.com/mrehorst/Allied_SX-190_SW_Receiver_Nov2003.rar

The file includes:
Allied Radio Shack Service Manual
Allied Radio Shack Owner's Manual
Ad from CQ magazine, May 1972
Ad from Radio Shack catalog
Review from 73 magazine
NASWA review by Ed Shaw
QST magazine modifications
CQ magazine mods, March 1973, by Bruce Mackey
Bandswitch mods by John Kolb
NASWA-FRENDX mods by Ed Shaw, May 1974
Comprehensive Technical Manual by Ed Shaw
Getting Reacquainted with the SX-190 by Ed Shaw, 4/77
Allied SX-190 Revisited, by Ed Shaw, 6/82

and includes newly added text files:

How I cured the hum in my SX-190's audio.txt
How I repaired my SX-190.txt

Thanks to Bob Bachus for converting everything to .pdf format!

If anyone has cleaner copies or additional info, I'd like to add
it to my collection. Please email markatrehorst.com (replace at with,
well, you know...)

Thanks!

4188. TS-480S Problem

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-07 03:35:02 UTC
From: IanCT <IanCThurston@nospam.hotmail.com>
Message-ID: <GpEqb.24941$Lz3.17341@newssvr27.news.prodigy.com>
Source record: 25611

I've the above mentioned rig, when I power it on
the LED's light up (all of them on the display) and
about 20% of them are flickering randomly. It is
stuck in CW mode, and any button that is pressed
doesn't do it. Can't change modes, can't do anything.

I don't have a manual and mods.dk doesn't have one
listed so I know how to perform a reset on the rig
(if possible)

Any ideas are appreciated.

I'm d/l'ing it right now.. not fast.. but it is 11 MB worth of file, and I
think it's coming from a dialup server. If your e-mail can handle a file
that size, I can e-mail it to you, otherwise, I'll CD-ROM it and snail mail.

4197. Anyone have mid 1960s Spiegel catalogs? (radio history research project)

> I just acquired a MSR2000 UHF Repeater at a price I could not refuse.
> Being new to Motorola I really need help. Are manuals available for
> download somewhere on the web?

Regrettably, Motorola doesn't work like that. However...

(After checking price/availability)

Give a call to 1-800-422-4210, get on with the order department,
and order these two numbers:

68-81061E40, MSR2000 Audio/Control Manual, $59.63

68-81061E55, MSR2000 UHF Base/Repeater manual, $41.87 (must be
used with the audio/control manual).

Yeah, I know it's about $100 worth of paper, but I can state with
absolute confidence that both manuals, between them, will give you more
than you ever wanted to know about that unit, including a full set of
schematics and parts lists.

Source record: 25637

FS: Yaesu FT-757GX and FP757HD/Speaker Power Supply

Before I take it to eBay, I thought I would give make it available here. I have a Yaesu FT-757GX with the matching the FP-757HD (Heavy Duty)/Speaker Power Supply. Both the radio and power supply are in very clean condition, non-smoking environment. It works well in all modes (CW-N & CW-W, USB, LSB, AM & FM), 10 thru 160 and WARC bands ,also including the new 60 meter band (MARS modified), 100w output (25w AM), dual VFO, memories and much more. Looks and sounds great! I would rate both units 9 out of 10. Also included are the operator's and service manuals, power cable, and the original handheld microphone with up/down buttons. Great looking combination. Selling both units as a set. Excellent adjunct to your existing station or even a new primary station. Asking $450.00. You pay shipping from Cleveland, Ohio. Please feel free to email me if you have any questions or would like additional info.

Thanks,
Pete, N8PB

I have a Motorola MT-1000 8 channel HT, drop-in rapid charger, and hand microphone for sale or trade. It is a public safety radio with ANI and an emergency switch that sends out the ANI code every few seconds when tripped. Programmed in the 453/458 MHz band.
The radio is in good physical and operating condition. Battery seems to hold a good charge.

Would like to trade for a 2 meter mobile or HT. Make me a reasonable offer.

E-mail questions or offers to: w8ems@juno.com

Change eight to 8 in my e-mail address to auto reply.

I am looking at a system 600, the lmr version

I couldnt get the radio to accept a freq, so I reset

using the power on method.

some functions perfom as I believe they should,

speaker on/off, noise blanker, etc.

... but I still cant figure out how to get the thing out of

mem and into vfo, and cant seem to get a freq into mem

any help would be appreciated

am I just not understanding how to program or is their a

prob with the radio. (and can I narrow that down ?)

thanks, rc

Hello all, I have a icom 756 i preformed the MARS mod but it did not work. anyone else have this problem?
Also i installed the 223 ssb filter. turned it on in the menu. it does show up on the main filter menu.But you can not select it, is this normal? Did a CPU reset. Even tried the Gen coverage button still will not transmit MARS.
Everything else works as it should.
Any help would be greatly appreciated.

Montgomery Wards Model: Airline 62-2500

BEAUTIFUL Montgomery Ward Airline 62-2500 floor model. AM and 6 to
18 MC shortwave. Works wonderfully after a good warm-up of an hour.
Seems I saw a label somewhere on the unit dated 1948. Tubes all check
out good. Replaced cracked AC cord. Rest is all original equipment.
$95 takes it. I would prefer pick-up, but will ship IF you are willing
to pay for a professional packing/mailing company to do the work.
(Probably run you around $60.) PLEASE CALL ME on this one to work out
details. It is a honey. (1.517.563.2613) 73 from Bill - WA8MEA ---

Hi ,
Does anyone have information on how to talk to the accessory socket of the Icom R70?
My purpose is to simulate a scanning function. I presume this is possible, but dont know anything about the format, levels and data types required for external frequency control, also the purposes of DBC, RC, RT, DV, etc.
Any comments appreciated.
thanks and regards,
JEFF

4234. FS: FIVE Yo-Yo-Vee Prototypes.....

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-10 01:01:16 UTC
From: wa8mea@hotmail.com
Message-ID: <8a260fb2.0311091701.2b40315b@posting.google.com>
Source record: 25557
Cross-posted to: rec.radio.amateur.swap,rec.radio.amateur.equipment

Greetings:

I've got 5 YO-YO-VEE prototypes I'd like to sell at discount. I wouldn't feel right selling them as new, because we did take them out in the field and test them. So even though they look new, technically they are used.

Some of you might be asking; "What the Sam Hill is a YO-YO-VEE?" If you're familiar with the Yo-Yo-Tenna Deluxe being featured in Worldradio magazine, or on banner ads at QTH.com and Eham.com, we've taken THAT antenna and placed a Budwig center insulator in the middle to make Inverted Vee operation a lot easier. (Easy mental picture to make since we don't yet have a "real" photo available. B&W AND color photos of the "Deluxe" also available at our website.)

Our retail on this will be $39.95 plus $7.95 shipping when available after the holidays. I'm selling these VERY SLIGHTLY "used" prototypes for $29.95 each plus HALF the shipping: $3.97

You're more than welcome to call me or even use our secure online form at our website. BE SURE to mention YO-YO-VEE prototype for the product description.

Again, I've only got five of these. We had six, but gave one away at our local club meeting for a door prize. So first e-mails get them!

This computer runs WIN APRS, does digipeating and runs off 6 to 60 VDC. Has GPS receiver, wireless LAN and Eathernet.
Great for freeing up your personal/family computers and having a reliable computer to run your favorite HAM Radio related software.

In all my years in radio electronics, I have never had more fun with any other computer.

4237. Comet CF360 duplexer, Icom 730 and a 2 meter rig.

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-10 04:08:06 UTC
From: Harvey White <madyn@ix.netcom.com>
Message-ID: <et3uqvokj8n3e2n6ero8fujjqlch4bi089@4ax.com>
Source record: 25560

That says part of it.

The comet CF-360 is rated 45 db isolation between the HF (1-30 MHz)
and VHF (49-470 MHz).

The Icom 730 is rated 100 watts (probably 200 PEP on ssb), the 2 meter
rig is rated at about 35 watts. I've got an MFJ 1296 antenna already
hooked to the 730, which is working well enough. I'll use the 1296
(which is good for HF, and also 6 and 2). I'll be using it to combine
the 2 meter and HF signals to the one antenna, so no surprise there.

Major question is if 45 db isolation is enough, all things considered.
Not an area that I know enough about to know if there will be a
problem, I suspect that there will not be a problem, but I'd like to
hear opinions.

Thanks

Harvey

Hi all,

I have a question. I recently acquired a Ten-Tec Omni VI in great condition, but I found that the RIT doesn't work. XIT is the same, so I assume the optical encoder for the RIT needs a replacement.

The radio is currently connected to Hercules II amp and 253 tuner.

Thanks.

<< I don't have a manual and mods.dk doesn't have one
listed so I know how to perform a reset on the rig >>

Ian-

I don't recall that model. Is it possible the TS-480S is a typo? Might it be
a 430 or 680?

Either way, your description of the problem makes me think of a CPU that is
hung-up. You might try exercising a master reset, but you might need the
manual to do that. Often a reset is done by holding down a particular button
or combination of buttons while turning on the power.

Another thought is that your CMOS memory battery is almost dead, but not quite!

4250. FT-80C missing buttons from FT-747GX

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-10 19:26:11 UTC
From: Sam Nelson <wa5vdm@arrl.net>
Message-ID: <cuovqvcgc9t3rdiar9ccs5v5s2tdvmkhn2@4ax.com>
Source record: 25575

As some of you probably know, the Yaesu FT-80C is basically the same
radio as the FT-747GX, except it is general coverage and is missing
some buttons that the 747gx comes with.
I am wanting to add the buttons to my FT-80C so that I can more easily
use it on my boat as both a Marine SSB unit and for HF ham fun.
The missing buttons are:
VFO-M
M-VFO
VFO/MR
SPLIT
PRI-M
FAST
BAND
If anyone has a FT-747gx parts list and can give me the Yaesu part
numbers for these buttons I would be very much appreciative.
Or, maybe a defunct 747gx and I could buy the buttons?
Thanks!
Sam, WA5VDM

There are lots of folks running the 'rice boxes'. I can attest by using the
following rigs to got results.

Yaesu FT-101 series.
Kenwood Twins

Newer rigs such as the FT-1000MP does fine also, and the new Kenwood TS-2000
sound good.

Running AM is fun, but you don't get the 'full effect' unless it smells
funny and once in a while catches fire.

It may be fun, but it is also inconsiderate unless on a little used
band. It takes up at least twice the spectrum of an SSB signal, and
possibly more - hardly necessary given crowded band conditions. Not to
mention the off-frequency heterodynes.

Just two cents worth from an old timer (licensed for nearly 65 years)
and brought up on AM.

I agree that it's important to be considerate, Bob. But even today, I think there's still room for playing around with AM, especially if one is carefull about the time of operation, the amount of power used (I'm planning on using 40 watts output or so) and radiating a good signal. No question that SSB uses less spectrum for voice communications, but, if one is willing to forgo the enjoyment (dare I say fun) of operating phone, one could conserve even more spectrum by operating CW exclusively. Obviously there's a trade-off involved (between the extra "utility", broadly defined, of higher fidelity signals and the extra, double as you say, bandwidth consumed), but, so long as operators exhibit good judgment and courtesy, I think the community's enjoyment of the hobby is maximized by giving people the choice of operating AM.

Your arguement is invalid. Considering modern day receivers with DSP, notch filters, and crystal/DSP IF filters. You don't hear the other sideband, or the carrier.....if you know how to use them that is.

Exactly correct. I operate AM on a limited basis. I also run less than
the legal limit for AM all the time.

I do not operate on 20 meters, nor do I operate on 75 after dark in the AM
mode. I can't speak for others.'

Paul, I don't understand this "higher fidelity" hype. Amateur radio is about communications, not high fidelity. Of course, AM is not the only mode that is using excess spectrum. I understand that there are sidebanders who are cluttering up the bands with their wideband signals, although I have to admit that I have never heard them because I do not listen much. But apparently Riley Hollingsworth has and has issued warnings about such operation.

CW obviously takes less spectrum, but let's face it, CW is dead. The times, they are a'changin'.

Frankly, at the risk of incurring flames, I would like to see AM outlawed on the HF bands, just as spark was outlawed even before my time. On the other hand, I firmly believe that ham radio is a dying hobby, vis-a-vis computers, so it won't make any difference in the long run.

Nice to have a civilized discussion.

Bob, W6NBI

Bob: I think you are wrong here. AM at the top of 10m hurts nobody. AM on 160 hurts nobody. proper AM operation on 80 and even 40 does not interfere with many (time of day, power and other considerations are important obviously.) Your CW comment has very little do with this issue. If it makes you feel better, substitute PSK for CW -- low power, very narrow bandwidth. Shall we outlaw SSB, AM, RTTY, and CW?

Is there a good reason why we must use the highest and newest technology at all times?

I admit that I am prejudiced -- I still make palladium prints and think hypo smells excellent.. I guess the same applies to my radio activities, too.

My mistake. It is a TS-430S. I have a TS-680 as well but got a little dyslexic... :)

I was thinking of the master reset, but I don't know the button combination. I'm trying different combos, no luck.

Thanks!

4270. Re: TS820 WARC BANDS

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-11 11:05:10 UTC
From: Michael Waldrop <mwaldrop@web.de>
Message-ID: <boqfpd$95b$03$1@news.t-online.com>
Source record: 25594

The 820 was built before the WARC bands. To modify
an 820 so it covers the WARC bands would require
loosing one of the preset bands, ie 40, 20, 15 or 10.
What one can do is use the "Fix" position for WARC
which, unfortunately, would not give one the ability
to move around with the VFO.

I have an 820S and from the tech manual this, in my
opinion, is the only way to put an 820 on WARC
without sacrificing a band switch position.

Maybe someone else has an idea on how to do this
but at the moment this is all I can provide.

4271. Re: Any Good Solid State XCVR for AM?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-11 11:21:57 UTC
From: Michael Waldrop <mwaldrop@web.de>
Message-ID: <boqgor$4ud$08$1@news.t-online.com>
Source record: 25595

An inexpensive solid state rig for "AM" use
is the Yaesu FT-757GX or GX II. There
are a number of them around for about
$300.00 without the power supply (FD-700/757
heavy duty power supply). Any 13.5 VDC 20amp
power supply will work with this rig and the power
supplies, FD-700/757, are cheap as well. If you
don't mind the size and weight there are a number
of other trasmitters, ie Hallicrafter HT-32/A,
HT-37, Heathkit DX-40, DX-60, DX-100
etc that will give you excellent "AM" results. The latter
rigs would need an outboard receiver capable of "AM",
not zero beating an "AM" signal although that
can be done. The HT-32A is an excellent "AM"
transmitter, I used one for years before selling it
because of shipping weight and desk space.

As for "Crowded bands", well that's been around
for years and a few stations using "AM" won't
be a problem. After all, "AM" was the original
mode of voice long before "SSB" ever came around.
That was not to mean that "SSB" is no more important
that "AM", just to say "AM" still works and a lot of
folks still use it.

I have no problem with stations that want to operate
"AM". So if you are looking for "AM" gear than
charge on my friend, there's tons of it out there for the
picking.

I agree. Bob, you are wrong about "AM".
There is absolutely nothing wrong with using
"AM". It is an authorized mode within the
amateur radio rules and regulations! In addition,
Bob, "AM" is not "Inconsiderate". "Inconsiderate"
is about "Operators", not a "Mode", who intentionally
interfere with amateur communications and who ignore
others.

As for your comment on "CW", I agree that
has absolutely nothing to do with the topic of
"AM" other than spectrum space.

I've been in the amateur radio community for over
35 years and enjoy "ALL" the modes the
FCC has authorized us to use.

Bob, there is more to amateur radio than "SSB".
"AM" is "F U N", as amateur radio is so why not
give it a try? You have nothing, absolutely nothing,
to loose. Who knows, you might even enjoy it
from time to time.

Maybe so, but in my part of the country, there's a group that gets up
at 5 o'clock in the morning to run AM on 75 meters, and their fat
signals do little harm. Good to hear the old timers keeping alive some
of our ham heritage.

It seems there are a lot of folks out there wanting
to know what rig is the best. Some may say Icom,
Kenwood or Yaesu, the top brands. Others may say
Alinco, Heathkit, Hallicrafters for the older, no longer in production
brands.

I've read postings where folks say "Amateur Radio is
too expensive and for us who are on a budget
the radio's are out of reach for us".

I say, and this is my opinion only, that's not totally
true. For the person on a budget, eBay, and other
outlets, there are hundreds of older equipment that
a new person can pick up for little investment.

Amateur radio should not be "Who has the best toys",
although to some that may be a true statement. The
object is to enjoy the hobby not break one financially.
I surf eBay as well as swap forums a lot and from what I
see there are thousands of rigs that would give folks a
tremendous amount of enjoyment in the amateur radio
hobby.

Honestly, for me that is, I don't care that much for
the new rigs of today. I'm sure they do an excellent
job of filtering out adjacent interference using the
newer technology "DSP etc. Having said that the
price of the rigs is too high for a new comer who
is on a budget. However, that doesn't eliminate
the other possibilities of older gear such as Drake,
Hallicrafters, Collins (well they're a bit pricey too
but thrown in for category reasons only). A few that
I believe are excellent rigs are the Drake TR-3,
TR-4, TR-4C and TR-4CW. They offer simplicity,
basic features such as USB, LSB, CW and AM.
They also provide the operator with up to 300 watts
input which is more than enough to start off with.
For the new comer who want all solid state there's
the Drake TR-5 and TR-7 series of transceivers.
These rigs provide basic features plus a few bells
and whistles not offered on the TR3/4 series rigs.
For the separate transmitter and receiver enthusiasts
there's the Drake T4X, R4, T4-XB, R4B, T4-XC
and the R4C.

Another is the Yaesu FT-757GX or GX II solid state transceiver. Here again, these rig(s) offers the operator USB, LSB, CW, FM and AM modes built in, nothing extra to buy other than the power supply which can be any 13.5 VDC at 20amp continuous output. This small rig offers many features such as 1.5 to 30mhz continuous receive, push button up and down between bands and a built in mic processor and 100 watts output in all modes except "AM", 25 watts. When used with the Yaesu FD-700 or 757 HD power supplies, key down times are limited to 30 minutes, although I wouldn't keydown for that amount of time.

Other used rigs are the Heathkit SB series and HW-101, all with basic features to get the new ham on the air.

Two more are the Swan 350 and 500 transceivers. Along with the Swan is the National NCX-5. All of these rigs have the basic features with sufficient power to give hours of operating enjoyment.

This is just a small amount of the rigs available for the new comer and budget minded hams that are there to do one thing, "Communicate on the Ham Bands". Their purchase cost is low and provide a means for the new comer and budget minded ham to get on the air at a fraction of the cost.

I recall when I started out over 35 years ago. My first transmitter was a Knightkit T-60, BC-312N receiver and 3 crystals. It was great fun and if I still had that combo I would use it.

In closing, I understand there are folks who would love to have the newest rig on the market, the one with the most bells and whistles. To that I say go for it. Having said that, for the folks who want to get on the air but think it's not possible because of the high dollar figure for today's rigs I say, look around there's more to amateur radio than owning a $2,500 radio. I believe that the hobby should be fun and whether the rigs new or used, don't get discouraged at the high cost of radios today.

Source record: 25498

Mike - Feb. 1983 QST featured an extensive mod for putting the 820 on the WARC bands. I don't recall any of the details any more, but I did the mod on my 820 back in 1983 and it worked very well. The mod to the final tank circuit for the WARC bands was rather difficult to do. There were also a couple of follow-ups to that article, and they're also listed on the ARRL website if you do a QST search for "ts-820 warc".

I have the following items for sale that are excess to my needs. Prices
do not include shipping. I will ship overseas.

Bird Wattmeter Slugs
All have been tested in my Bird 43 wattmeter.
2500H Slug: 2-30 MHz, 2500 watts.....$100 plus shipping
http://members.cox.net/radiostuff9/bird2500.jpg
100A Slug: 25-60 MHz 100 watts.....$80 plus shipping
http://members.cox.net/radiostuff9/bird60wvhf.jpg
50D Slug: 200-500 MHz, 50 watts.....$75 plus shipping
http://members.cox.net/radiostuff9/bird50wuhf.jpg
161A Slug: 400-1000MHz, 25 watts.....$75 plus shipping
http://members.cox.net/radiostuff9/bird25wUHF.jpg

Swan WM-2000 Wattmeter.....$75 plus shipping
This meter covers 3.5 to 30 MHz and measures SWR and power. Power is
measured in 2 ranges: 0-200 watts and 0-2000 watts.
This unit is in excellent condition and works well.
http://members.cox.net/radiostuff9/swan_wm2000.jpg
http://members.cox.net/radiostuff9/swan_wm20003.jpg

Sonar LP Filter - NIB E.F. Johnson Clone.....$45 plus shipping
This looks like a clone of the EF Johnson low pass filter however it has

a neat chrome finish. This is new in the box with instructions and
mounting brackets. This is a 52 ohm filter that will handle 1 KW from
2-30 MHz.
http://members.cox.net/radiostuff9/sonar_lp_filter.jpg

National Type MCN Vernier Dial - New in Box!.....$45 plus shipping

http://members.cox.net/radiostuff9/mcn.jpg
http://members.cox.net/radiostuff9/mcn2.jpg

Metrotek Mustang Vintage 1960's Tube CB Radio.....$80 plus
shipping
Easy conversion to 10 meter AM. This is a 7 Tube Transceiver from the
mid 1960's. It has a tunable receiver and 6 crystal controlled channels
for transmit and receive. This will work on 110 and 12 volts. The radio
works great on transmit and receive. it currently has one channel
crystalled up. The power cord included is for 110 volts. It has the
original factory microphone. The inside is clean and unmodified with no
signs of abuse or burned components. It also includes the factory mobile
bracket which is not shown.
http://members.cox.net/radiostuff9/Mustangcb.jpg

http://members.cox.net/radiostuff9/Mustangcb3.jpg

Gonset Communicator III - 6 Meters.....$75 plus shipping
This is a separate receiver and and crystal controlled transmitter from
the 1950's . Unit works but needs dial cord restrung on receiver.
Includes a bunch of crystals. The radio has a number of scratches.
http://members.cox.net/radiostuff9/gonset_comIII_6m.jpg
http://members.cox.net/radiostuff9/gonset_comIII_6m2.jpg

Eimac 4-125 Transmitting Tube and Socket.....$65 plus shipping
The tube appears new. I checked the filament for continuity which it
has. The brown color in the glass is a reflection off of the beige
background. The socket is used.

I thought the question was about what kind of rig is usable for AM. I do not us AM but I do listen at times to some locals, and is good to see many modes still used. My Icom 765 should work for AM, and some day I might try it just to say HI to the group. There is plenty of room on the bands for their use.

Message-ID: <20031111112512.28460.00000007@mb-m14.aol.com>
Source record: 25503

I have a Standard GX1510 (Same radio as the Uniden SMU4525KT). I just got the programer for it (A1510). I am able to read from the radio no problem. When I try writing to it, I get a verify error. I am running the DOS program under WinXP Home in the command prompt mode. I've tried 2 different "slowdown" programs, thinking that was it, but with no results.

Anyone have any suggestions?

4281. Where to obtain an Ameco TPA tunable pre-amp/active antenna?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-11 17:06:26 UTC
From: Joel Kolstad <JKolstad71HatesSpam@Yahoo.Com>
Message-ID: <bor4svqfs1@news.oregonstate.edu>
Source record: 25504

Does anyone know where I might be able to purchase an Ameco model TPA tunable pre-amp/active antenna? Apparently they're no longer able to obtain a particular component in it and therefore it's no longer being manufactured. I'll probably end up using an MFJ-1020C instead, but from reading reviews on the 'net the Ameco TPA is really the better device.

I'd also be happy to purchase someone's used unit!

Thanks,
---Joel Kolstad

I hear you, Bob. Still, I think a reasonable argument can be made that words are but a part (admittedly, the largest part, by far) of communicating, that contacts are enhanced when the communicators voices are received as they would be face-to-face. I'm just getting back into ham radio after being out of it, essentially, since the late 70s. So I'm not really aware of any increased popularity of AM being due to its greater audio fidelity. My guess is that any increased interest in AM these days has as much, if not more, to do with the nostalgia factor than higher fidelity audio. Even though SSB was firmly established when I got started in ham radio in the late 60s, AM was still in use enough for me to have some exposure to it. Rightly or wrongly, I kind of associate it with the "good ole days" which, for me, meant the days when people were still amazed at being able to communicate over long distances without wires with a community of people who were friendly and often very, very radio savvy.

> CW obviously takes less spectrum, but let's face it, CW is dead. The
> times, they are a'changin'.

Wow, now there's a topic. I wouldn't say CW is dead, but I would say it's a lot less popular than it used to be. I agree the times are changing. I hear expletives and exchanges on the air these days that I never (or virtually never) heard there 30 years ago. My impression is that the percentage of operators these days with a firm technical grasp of radio is significantly less than it was then. For better or worse, I'll let you and others decide, ham radio today seems to work and sound to me a lot more like CB radio did back then (and probably still does today).

> hobby, vis-a-vis computers, so it won't make any difference in the long run.

You'll get no flame from me. I understand your point of view and at some point may end up agreeing with it. I just don't think banning AM at this time is necessary or desirable. As to ham radio dying, it depends on what you mean by "dying". I agree with you that many people will end up experimenting with and communicate using

computers who in the past would have gone into ham radio. And, I'll venture to guess that of the pool of "potentials" who end up pursuing one of the two hobbies exclusively, the larger group will go into computers (if we're lucky, that group will include all of the inconsiderate rubes, not all of whom are CB-type appliance operators, that one seems to encounter on the airwaves with greater and greater frequency - no pun intended - these days. But, I don't think this necessarily results in the death of ham radio. I think that there will always be enough people interested in the concept and application of radio, communicating without any kind of physical connection, for the hobby to remain alive. My recent introduction to the Elecraft community of kit builders and radio operators gives me much hope in this regard. But, of course, I could be wrong.

I have an Icom R-75 receiver that I plan on using. I like the idea of going with an old Heathkit because of their relatively small size, simplicity, and, yes, a bit of the nostalgia factor. But I've noticed that some of those units in good condition are going for almost $100 (more, if they've got a VFO, which I would have to have). I was surfing the net and saw a used Icom 735, which would interface very nicely with my R-75 (doesn't the 735 come with ICOM's CI-V equipment link?), for $250; yes, that's more money, but then I get FM capability, a built-in backup receiver, etc.

4284. Rx/Tx pC based for a Sailboat

Hi everybody,
I try to get Informations to choose a Rx like the Winradio WR1500e or the Icom PCR 1000 to be able to use on my sailboat for navtex weather fax .....And may be satellite.
I would like to have your advise on these interresting black box radio, or may it is better to have a normal Rx, but I need a 12 VoltsDC, for the power supply on the boat, small, and stong enougth for the marine environment.
If you can give me some ideas of type, price...It will be superb. May a Transceiver will be just find and will offer me news horizon (Hamradio)????
Best regards for all.
JP

Bonjour a tous,
Je recherche des renseignements et des conseils choisir un type de recepteur petit de taille pour pouvoir avoir le navtex, fax meteo, et peut image satellite, j'ai pense au Winradio WR 1500e ou autre models Icom IC-PCR1000 Y a t-il d'autres models du meme type???

Ce type de model externe black box a t-il la meme sensibilite ???
Peut t-on en trouver d'occase???
Le critere principale est l'alim 12V, la taille, est la resistance au milieu marin!!! Un Tx ferait-il l'affaire cela me permettrait de faire un pas vers les Om
Merci de tous vos conseils

I'm looking for service information for a 1960s
Hammarlund CB-23 tube-type base station CB set.
I found and downloaded the text portions of the
owner's manual which covers operation and basic
alignment, but I need a schematic, block diagram,
voltage and resistance charts, etc. There's no
Sams Photofacts on this one, so I must have the
original Hammarlund documentation. Please help
me to restore this interesting classic radio!

Lafayette Radio also sold this same transceiver
as the model HB-200 (I think that's correct).

Thanks and 73,
Dean K5DH

4286. FS Larsen NLA-27 Antenna Coil

4288. HELP WITH KENWOOD TS-940S AT PLEASE

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-11 21:13:26 UTC
From: Murray Green <mgreen@erols.com>
Message-ID: <3FB150F6.76FDA164@erols.com>
Source record: 25512

A ham friend of mine has a problem with his Kenwood TS-940S, For some reason, he cannot get the Automatic Antenna tuner to work on 160, 75 or 40 meters. When he hits the ATT, AUTO and SEND buttons, the tuner seems to start trying to find a match, but just keeps hunting back and forth and then cuts off. He does not have this problem on the other bands. He has tried tuning into his 50 ohm dummy load, and still has the same problem. (As a aside, one night when he was not paying attention to what he was doing, he kept hitting the ATT button on and off while on 75/160 and 40 meters.)

He cannot find anything in the operations manual on how to adjust the auto tuner. Any help out there please?

Also is there a Kenwood Users Group he can check into?

Please respond here and/or to WA3DVO@msn.com

Thanks.

Fellow Ham's,

I recently repaired a FT101E for a caregiver to present to a retired Catholic priest of the Maryknoll order in Los Altos hills, CA. While the caregiver got the radio for free and I repaired it for the cost of parts he lacks a microphone to go with it.

If you have a suitable microphone you could donate it would go a long way to get this going. The caregiver / Ham who is providing the radio is Dan Saunders / KI6FA.

Please reply to me via email if you believe you could donate a suitable mic. and I will pass the info on to Dan (he currently lacks access to USENET). When replying please remove nospam from my email address.

Thanks for taking the time to read this appeal!

It's not an adjustment. It probably has a stuck relay. Usually the 20m one.

the mic for a FT101 is the same mic as the Cobra/Uniden 4 pin CB's use....
any truck stop should have one at a good price that will work... 10-12
dollars

Andy -

Find a computer running true DOS, and preferabley a slow 486 and you should
be in business.

XP is not a good platform for programming the older radios.

Yup that's how a lot of us got started and many people run those radios forever. Many of them are as fine as the new radios as far as transmit and receive go. They just don't have all the fancy bells and whistles that, while fun, are actually unnecessary.

>capability, a built-in backup receiver, etc.

As far as Heathkits go, the DX-60 was a relatively simple am-cw
transmitter. About 60 watts, screen modulated. The Johnson Ranger,
with 75 watts, was plate modulated, and had much richer audio,
although much more complexity. It sounded as strong as other AM rigs
running hundreds of watts.

A Heathkit DX-100, if you can handle the weight and size, would be
ideal; plenty of power, no amp needed, and a built-in vfo.

I have an Icom 735 -- never tried it on AM. It does have the ci-v link
on the back. Rated at about 25 watts on AM. Not sure whether many
people will be able to hear you at that level, though -- most of the
AM'ers I hear on 75m are using amplifiers to cut through the static

and hash.

Try 3885 khz at about 5 a.m., any morning. A lot of these guys have several AM rigs sitting around, gathering dust, and you could probably pick one up for a song.

Good luck...

Another example of a simple question where the threads stray so far off
topic, he question isn't even addressed in the end.

Paul, to answer your question:

The FT101's sound very good with a D104 microphone. If you are looking for
a good current solid state rig, the TS850 with the DSP100 and modulator feed
is very hard to beat. Of course, these are my opinions only and others may
disagree.

Max

Jerry, not sure I understand the question. I mean, most tuners, manual
or automatic, cover all hf frequencies -- tho' some are better at 160m
than others. But most have no problem with 80 through 10. My mfj989c
easily handles all hf bands -- it tunes a 44 ft. dipole on every band
from 30m-10m. If it were longer, I could get 40 and 80, too.

Of course, if the antenna is horrible, the tuner won't cover any of
the bands :-)

Troy, take the drive knob off and make sure the shaft to the optical
encoder is not solid, this is common with steel shaft running in a
brass bush. some wd40 on the shaft left to soak in and then work the
shaft gently back and forwards till it frees up. I'd put money on it
that this is your problem
Good Luck
Dave

From: dummy@we1md.com
Message-ID: <624413f5.0311121346.5ec906ac@posting.google.com>
Source record: 25534

I have an FT-897 both filters 2 batteries and charger. There is some cosmetic scuffs and the RIT knob has been repaired.
MARS/CAP with frequency stabilizer.

I am the original owner.

I would swap for late model Icom 706MKIIG or FT-100D

I really would prefer a mobile rig and have not interest in QRP w/ batteries.

contact me directly at WE1MD@arrl.net

LIMARC (the Long Island Mobile Amateur Radio Club) has had two Field Day meetings in preparation for the big event next June. We want to improve our emergency preparedness and we feel that it's to the club's and public's advantage to get an early start. We want to be ready far in advance of this event.

LIMARC feels strongly about being ready to assist in any type of emergency situation. We would like to be ready to do our part for public service.
At this time LIMARC is looking for donations of towers, telescoping masts, beams or vertical antennas, radios, etc. to be used for the Field Day event, or any other emergency where we may need to provide emergency communications.

If you have any of the above items, and are not using them, and would be intersted in donating to our cause, please contact Jeff, N2ION@AOL.COM or by phone at 516-356-0800.

The club will provide you with a donation confirmation document letter for tax purposes.

We really need your help at this time so please try to assist us as best you can.

Thanks & 73,
Jeff, N2ION
Co-Chairman-LIMARC Field Day Committee

I have a 989c, and it ain't junk.

What's your problem? It may be the tuner. It may also be the antenna.
Or it may be the feedline. No tuner will tune just anything.

4316. Repeater experts....HELP!

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-13 13:49:00 UTC
From: me <nospam@hotmail.com>
Message-ID: <01c3a9ed$368f2540$82878685@clip>
Source record: 25539

Hi guys. Thanks in advance for any help. Please post
responses in NG as my email 'reply' address is fake
since some don't know how to mind their manners.
I recently put back into service a Hamtronics REP100
two meter repeater with a new Telewave Duplexer and
the antenna is a Ringo Ranger II with radials. Coax to
the antenna is RG8 superfoam and jumpers between
repeater and duplexer are RG8 superfoam.
Here is the problem. I am experiencing 'desense' on
the repeater to the point where it takes a signal of S5
or better to get in. A lesser signal just makes the
repeater "chop" (continually opens and closes the
transmit side. The Duplexer was factory tuned
(for what it was worth) and I did 'tweak' it and got a
much noticible improvement. Before tweaking, it took
an S9 or better to get in. I realize I should be running
(supposedly) double shielded jumpers from repeater to
the Duplexer, but I can't imagine they are going to make
that much difference. I am also told to mount the duplexer
in it's own enclosure (it's rack mount so that would be cute)
to keep it away from the repeater.
The Hamtronics manual says you HAVE to use a
duplexer with at least 95 db of isolation (try to find one)
and mine is 77db. I really can't imagine there is not
enough isolation, because I know where there are other
machines running with old duplexers with much less
than 77db of isolation. Just to add to the mix, I sent
the repeater up to Hamtronics and had it tuned and
checked out and it is 100 percent, so I *suspect* it
is not a repeater problem. (Someone suggested to
try killing some of the sensitivity of the reciever).
So....looking for ideas and suggestions on what to try
next (other than double shielded jumpers to the duplexer).
Thanks for any help or ideas...

Double shielded jumpers. And the length may be a component of what exact frequency, so you may have to get with Telewave for advice on that. RG8 is not in my opinion good for the run from duplexer to antenna either. I would look for (depending on length of run) 1/2" or 7/8" hardline.

How did you "tweak" the duplexer? With two service monitors or, one with a tracking generator?

I'd replace the jumpers and feedline.

4326. Yaesu FT-707 ALC question

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-13 16:03:24 UTC
From: chvjillson@aol.com
Message-ID: <c4a913b3.0311130803.b1d4f8b@posting.google.com>
Source record: 25399

Hi Folks:

I just purchased a Yaesu FT-707 HF rig, and I'm trying to get familiarized with each function of the rig.

What exactly does the ALC do? I'm assuming it's some sort of limiter, but is it used only when 'tuning up' a rig? Or is it common practice to use it at all times? Does the ALC limit my power output in any way?

Thanks for your help.

Source record: 25400

1st Use superflex 1/4 - 3/8 hardline jumpers between duplexer and
repeater....
2nd Make sure that if the duplexers are in the same cabinet as
repeater,put some sort of shield between the two...
3rd Use at least 1/2 inch, preferrably 7/8 hardline from cans to
antenna, as even the LMR coax is still more lossy at 2M...
4th Make sure all connecters cables are solidly connected.
5th Use a poly phaser lightning arrester as it will ground cable,
and make sure cabinet(s) are/is grounded, with a good earth ground.

Get rid of the RG8 superfoam and go with hardline!!!!!!
That's causing a lot of your problem..... too much loss of signal.

I used to run a 2M repeater, and I found that the above are a must for
good reception.. Also Hamtronics is correct, you should have a better
set of duplexers, my old set was around 105db isolation(6 can set about
30" tall) and I put them in thier own metal cabinet.

Good luck

Bob N9LVU

Bob,

I actually wondering about specific tuners. Which ones
are particularly for the IC735 and which ones work best
for the 706. Not being familiar with them, I am trying to
avoid having to adapt plugs, etc. The 735 plug is square,
the 706 had a thin plug with a < shape at one end. Just
was not awake when I posted this, eh?

Also, I am told that some tuners don't do full coverage
1.8-30 MHZ, but have "gaps" at certain freqs. I have never used an
auto-tuner before, so I was looking to see
what's available for these radios.

Dan,

Like you, I run AM at times, but I do it during the day when many ops are at
work anyway. Usually it's on 7290 or 95. If someone tells me I am messing
them up,
I will yield immediately. After all, it's only a hobby and
courtesy should be the order of the day---at least, that's
what I was taught.

Factory Kenwood TS570SG (HF + 6M) in excellent condition. Purchased July this year. Not a mark on this one, looks like new. Has the stock 2.4 khz SSB filter as well as a Kenwood 3 Khz filter for wider SSB. Balanced modulator feed and IF tap for hookup to a scope. Looking for something a little bigger on my desk, like an 850, newer 940, FT990AC, or the like. Let me know what you have. Digital pictures available upon request.
Thanks for reading.

Do not reply to this e-mail,, please reply to ve3tmt@rac.ca

> Bob, W6NBI

Let's put the shoe on the other foot. Even with the wider
bandwidth with AM, why should the AMers have to yield to SSB? The point is
to be courteous to ALL oper-
ators and if there is a signal too close to me, I just move.
There still is plenty of room. Why are ops so "territorial"--they MUST
operate on a certain frequency or just DIE!
They get all bent out of shape if someone happens to be
on "their" frequency. Why not just move away a few khz? I will move in a
heartbeat--even if a rude op tells me
to "hit the road" (ever heard that phrase?). It doesn't mean that much to
me. The AM guys usually operate at the top end of 80, 40, and 10 Meters,
leaving the rest of
the band to the SSB folks.

The point is, all ops have just as much right to operate as
any other. AM is still legal, and many fellas love it. I only do so on
occasion and chat with a few of my friends on
7290. I run 40 watts with an IC706; most of the time, however, I am on SSB.
I do still miss that warm glow in
the shack and the sound of the CLACK as the dynamotor kicks on my old mobile
Lettine about 38 years ago.

Tuners of the same type, L, T, Pi, are all the same.

The trick is to choose the antenna and feedline to suit the tuner.

As the others already said, you MUST have very well shielded jumpers. RG-214 will do if you have some, otherwise go with super-flex hard line. Both are often available on eBay. Try to stay away from the LMR coax, as it consists of a braid and foil shield which expand at different rates and cause all sorts of noise problems. Great as far as shielding goes, however. Super-flex cable is corrugated and has just a copper outer conductor so no metal expansion to worry about, but it can't be bent too many times. Excellent for use in and around repeaters and will work well outside if you tie it down properly. You may want something larger than 1/2 inch depending on the loss your system can tolerate.

Depending on your Tx/Rx spacing, you could get away with less than 95 dB of isolation in the duplexer, but a 4-cavity unit will give you about 80 dB at best, so you really want a 6-cavity unit. Alternatively, a very tight receiver might help you, such as a Motorola Micor or MSF5000.

The antenna could also be a source of desense. There aren't many ways to prove where the desense is coming from, but a good spectrum analyzer on the receiver's antenna input might tell you if you're getting signal directly from the transmitter, through the duplexer, or back from the antenna.

Connect a dummy load to the output of the duplexer and use a signal generator to key the repeater. Check if you still have desense that way. If so, the problem is in your cables and/or duplexer and/or repeater. If not, it's a function of the antenna and feed line.

A friend of mine is having a similar problem and he has gone through all the appropriate steps. His desense appears to be coming down from the antenna, and in his case it takes an additional 15-20 dB of signal (using a signal generator) to keep the repeater open once the transmitter comes on. I can't tell you how many S-units that is, but it's still a lot of signal, and he has a 4-cavity duplexer and is running a 1 MHz split. Operation with a dummy load is 100% perfect, so his problem is external to the equipment.

Unfortunately, if the signal is coming down from the antenna, then you could have a 60-cavity duplexer and it wouldn't eliminate the desense.

> 73's Rick

Why ask for help here when you will not follow simple instructions ?

You must use double shielded cable or beter (solid shielding like heliax)
to the duplexer. Many times to the antenna also. The ringo is a terrable
antenna to use in repeater service due to the coupling to the feedline.

The ammount of duplexer isolation is determimed by how much trash the transmitter puts out for one thing. A good clean transmitter (usually one using tubes for the amplifiers) can get away with less than the comsumer grade trtansmitters.

Go here and pay attention to what is being said.

Try: <http://www.cloningsoftware.com/yaesu_template.cfm>

They have the cable and software, individually or together.

Note that the cable needed is the same as the one used for the
FT-11/41/51, FT-10/40/50, VX-1, VX-5, and VX-110/150.

Happy trails,

Looking at page 21 of my 735 manual, the Icom AT-150 auto antenna
tuner is the tuner designed for the 735. Use the accessory cable
supplied with that tuner.

Also, the 735 will take the Icom IC-AT100 or AT500, but you need the
OPC-118 interface cable.

All three tuners work automatically with voltage supplied by the 735.

It doesn't say how continuous the hf coverage is, tho'.

4347. kW-class amp : where goes the power ?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-14 21:02:36 UTC
From: Thierry <Thierry>, see http: //www.astrosurf.com/lombry/;
Message-ID: <3fb542ea$1_2@news.vo.lu>
Source record: 25419

Hi,

I would like to buy a desk kW-class amplifier (tube or solid-state) but before I try to get as much information I can about advantages and drawbacks of each model (I have 12 tubes amps to compare while solid-states are not numerous between Icom - too expensive -, Yaesu and Tokyo Hy-Power).

I learnt for example that Yaesu VL-1000 Quadra displays a RF ouput of about 1kW PEP, in line with its specs
On the contrary the Tokyo Hy-Power HL-1KFX, 1.2 kW PEP provides less than 600W peak output (250W in RTTY or AM), even using an antenna tuner to get a VSWR 1:1 on the working band. So we cannot really say that the lost power (in this case 600W) is lost as heat as my SWR on the line is well 1:1.

Can someone explain me where goes the lost power in the Tokyo model or if my reflexion is faulty?

Thanks in advance

Thierry

I have the following items for sale that are excess to my needs. Prices
do not include shipping. I will ship overseas.

Eico 315 Signal Generator.....$50 plus shipping
This signal generator that covers 75 kHz to 150 MHz in six bands. Output
is either a modulated or a pure RF signal. The unit is in nice shape and
works. Includes a copy of the manual.
http://members.cox.net/radiostuff9/eico315.jpg

"The Portable Radio in American Life" .....$35 plus shipping
This is an out of print 260 page book published in 1991 covers the
history of portable tube radios and transistor radios from the 1920's to
the 1970's. Includes historical information on Sony, Zenith radio,
Admiral radio and many other brands who built portable radios. This is
an excellent reference book if you collect portable and transistor
radios. This is a new book which is still sealed in the wrapper. The
photo is of my copy. This is a great radio reference book. I have 10 of
these books.
http://members.cox.net/radiostuff9/portableradiobook.jpg

Lafayette HB-76 VHF Receiver.....$50 plus shipping
This is a VHF receiver from the 1960's that covers 152-174 MHz. The
unit is in excellent condition cosmetically and does work.
http://members.cox.net/radiostuff9/laffvhf.jpg
http://members.cox.net/radiostuff9/laffvhf2.jpg

Set of crystals for the Navy TDQ transmitter...$135 plus shipping
Their are 24 crystals of which 23 are the original Navy
crystals; one crystal is not. The wooden box is in great shape also.
http://members.cox.net/radiostuff9/tdq_xtals.jpg
http://members.cox.net/radiostuff9/tdq_xtals2.jpg

Heathkit V-6 VTVM.....$35 plus shipping
with a photocopy of the manual and test leads. This is a vintage VTVM in
nice shape. The unit works but needs to be calibrated. This is explained
in the manual and is pretty straightforward.
http://members.cox.net/radiostuff9/heathvtvm.jpg
http://members.cox.net/radiostuff9/heathvtvm2.jpg

Swan WM-2000 Wattmeter.....$75 plus shipping
This meter covers 3.5 to 30 MHz and measures SWR and power. Power is
measured in 2 ranges: 0-200 watts and 0-2000 watts.
This unit is in excellent condition and works well.
http://members.cox.net/radiostuff9/swan_wm2000.jpg
http://members.cox.net/radiostuff9/swan_wm20003.jpg

Sonar LP Filter - NIB E.F. Johnson Clone.....$40 plus shipping
This looks like a clone of the EF Johnson low pass filter however it has

a neat chrome finish. This is new in the box with instructions and
mounting brackets. This is a 52 ohm filter that will handle 1 KW from
2-30 MHz.
http://members.cox.net/radiostuff9/sonar_lp_filter.jpg

National Type MCN Vernier Dial - New in Box!.....$45 plus shipping

http://members.cox.net/radiostuff9/mcn.jpg
http://members.cox.net/radiostuff9/mcn2.jpg

Metrotek Mustang Vintage 1960's Tube CB Radio.....$80 plus
shipping
Easy conversion to 10 meter AM. This is a 7 Tube Transceiver from the
mid 1960's. It has a tunable receiver and 6 crystal controlled channels
for transmit and receive. This will work on 110 and 12 volts. The radio
works great on transmit and receive. it currently has one channel
crystalled up. The power cord included is for 110 volts. It has the
original factory
microphone. The inside is clean and unmodified with no signs of abuse or

burned components. It also includes the factory mobile bracket which is
not shown.
http://members.cox.net/radiostuff9/Mustangcb.jpg
http://members.cox.net/radiostuff9/Mustangcb3.jpg

Gonset Communicator III - 6 Meters.....$75 plus shipping
This is a separate receiver and and crystal controlled transmitter from
the 1950's . Unit works but needs dial cord restrung on receiver.
Includes a bunch of crystals. The radio has a number of scratches.
http://members.cox.net/radiostuff9/gonset_comIII_6m.jpg
http://members.cox.net/radiostuff9/gonset_comIII_6m2.jpg

Eimac 4-125 Transmitting Tube and Socket.....$65 plus shipping
The tube appears new. I checked the filament for continuity which it
has. The brown color in the glass is a reflection off of the beige
background. The socket is used.
http://members.cox.net/radiostuff9/4-125.jpg

Drake ML-2 Marker Luxury 2 Meter Transceiver.....$80 plus shipping

This 1971 2 meter transceiver has a solid state receiver and a tube
final putting out 10 watts plus. Also has a built-in AC/DC power supply.
This one is in nice condition and works well. This one has the original
crystals for 34-94, 94 Simplex. For more info on this radio visit this
link: http://www.dproducts.be/Drake_Museum/ML2.htm
http://members.cox.net/radiostuff9/drake2m.jpg

4349. Re: Which Tuner??

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-15 07:00:38 UTC
From: Michael <mwaldrop@web.de>
Message-ID: <bp4iunqqg08$1@news.t-online.com>
Source record: 25422

Jerry,

There a number different tuners that will work. Using a tuner with
a rig such as the IC706MkIIG does not have to be interconnected
with control cables. An example is a Yaesu FT-757GX using a
Drake MN-4 or MN2000 manual tuner. The only requirement is
the coax between the rig and the tuner plus the antenna coax to
the output of the tuner.

Which one is best? I believe it's the users choice but power must
be taken into consideration. You wouldn't want to use a Drake MN-4
tuner (300 watts max) being fed with a KW yet you can use the Drake MN-2000
(2KW max).

As for the rigs that have tuner control and an autotuner is available for
that
rig, IC706MkIIG with it's outboard ICOM AT-180 autotuner, then I would think
it's whether
the user wanted to spend the money for such a tuner. I have a Yaesu
FT-757GX with it's outboard autotuner FC-757AT and that combination
works very well as does my FT-767GX/AT.

The type of antenna you intend on feeding, longwire, dipole, Zep or yagi
should also be considered. Long wire tuners usually contain either a fixed,
tapped, inductor or a roller inductor which, in my opinion, gives one a lot
more flexibility. The older Johnson KW tuner is an excellent piece of gear
provided the user has space for it. Coax tuners are designed for coax fed
antennas and do not function well in a "Long wire" configuration. The Drake
MN-4 and MN-2000 are examples of coax fed antenna tuners. The Johnson
KW is an example of a "Long wire" fed antenna tuner.

If one is a builder then the parts needed to build a "Long wire" tuner or
"Coax
Fed" tuner are plentiful and "Fair Radio Sales" in "Lima Ohio" is a good
start
for parts. Ebay has Johnson roller inductors, small and large, at times and
the
prices I've seen aren't that bad considering the cost of "New" from the
manufacture.
I built a tuner out of 2 variable caps and a roller inductor on a piece of
wood
and it tuned anything from a bedspring to a 200 foot long wire but it was
"Breadboard" and unsafe.

There are numerous brand name tuners available at as little at $100 yet the
autotuners are somewhat higher in price. When considering a tuner addition

to your shack, consider what type of antenna you will be feeding. As for
it's looks, well all I can say is "It doesn't matter as long as it does the
job
it's intended for and it's "SAFE" to use. You might not want to
"Breadboard"
a full time tuner unless it's located where you or other can come in contact
with
the tuners components.

Hope this helps. By the way, the Drake MN-4 does an excellent job on yagis
and dipoles if the antennas is slightly out of resonant but the power
limitation
is 300 watts maximum. The Drake MN-2000, although considered the "Big
Brother" to the MN-4, will do the same and the power handling is rated at
2KW and both have a built in SWR meter with switchable antennas, i.e. feeds
2 antennas 80 to 10mtrs with a "Straight through" position which takes the
tuner out of line and feeds the transmitter/transceiver directly to the
antenna.
Good for checking out other bands without disturbing your tuner settings.

Good luck and 73's,

Michael

Source record: 25423

Hallo
I purchased japaniese version of IC746. Of course I want to have full option TRX so i tried to unlock transmitter and (more important) receiver. I managed with receiver but there is a gap with transmiting beetwen 26-28MHz. Does anybody know a method to unlock this range of frequency ? Its not realy very important but as I said I want to have full option TRX... :-) It was heard thad CPU replacment may help but this part is probably expensiv one. Mods on www.mods.dk dont work. Any answers ?

Montgomery Wards Model: Airline 62-2500

FOR SALE: BEAUTIFUL Montgomery Ward Airline 62-2500 floor model. AM
and 6 to 18 MC shortwave. Works wonderfully after a good warm-up of an
hour.
Seems I saw a label somewhere on the unit dated 1948. Tubes all check
out good. Replaced cracked AC cord. Rest is all original equipment.
$95 takes it. I would prefer pick-up or meeting. (I live in Southern
Michigan.) Will ship IF you are willing to pay for a professional
packing/mailing company to do the work. (Probably run you around $60.)
PLEASE CALL ME on this one to work out
details. It is a honey. (1.517.563.2613) 73 from Bill - WA8MEA ---

remuneration.

Have a look at the manufacturers of GSM chipsets like Analog Devices,
Motorola, Texas Instruments, Siemens. They often have reference designs and
evaluation boards.

4356. ICOM monitoring scope or panadaptor

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-15 22:52:28 UTC
From: Joe McElvenney <ximac@btinternet.com>
Message-ID: <VA.000000e8.008898d6@btinternet.com>
Source record: 25429

Hi,

If ICOM ever produced one of the subject items to go with the ICOM R-71A receiver or some similar equipment, I would appreciate knowing the model number so that I may find out the RF input requirements.

I am trying to ascertain the specified output level from the 'scope' socket (70.4515MHz) of one of these receivers but neither the workshop or operator's manual mentions it. Measurements show that it is quite low, just as an inspection of the schematic might suggest, but there is still a nagging doubt that the receiver is not quite up to specification as the antenna to scope socket loss is around 30dB.

It is all about how you read the specifications.

The VL-1000 has 1.0kW output for 2.1kW DC input

The HL-1KFX has 0.6kW output for 1.2KW DC input.

It's either an electroluminescent panel or vacuum fluorescent panel that is
part of the LCD stack. You should be able to see it on the schematic and
see where the high voltage goes into the panel. Check to make sure it is
getting voltage before replacing it.

and mine is 77db. I really can't imagine there is not
enough isolation, because I know where there are other
machines running with old duplexers with much less
than 77db of isolation >>

Rick-

I would guess your duplexer was intended for a commercial repeater that had greater separation than 600 KHz. You are kidding yourself if you think you can make it work. Those other repeaters with old duplexers either have desense or have some kind of super filters in the transmitter and receiver chains.

About the only thing that might help you (after you get that double-shielded co-ax) would be adding a couple extra cavities. Although that approach will probably have a higher insertion loss, it may be possible to tune the resulting set for sufficient isolation.

If you can't fix the cavities, then all you can do is reduce transmit power out of the repeater. If you reduce from one hundred to one watt, you pick up the equivalent of 20 dB of isolation.

(A four-cavity duplexer with 95 dB isolation may be possible, but the cavities will be big ones.)

Troy, take the drive knob off and make sure the shaft to the optical encoder is not solid, this is common with steel shaft running in a brass bush. some wd40 on the shaft left to soak in and then work the shaft gently back and forwards till it frees up. I'd put money on it that this is your problem
Good Luck
Dave

Rich....
I just replaced the meter lamp in my TR751A, and got another 751A with dead bulbs... so I'll be doing it again.
You can play games with LEDs and dropping resistors, or jam something from Radio Shack in there...
Or order the correct bulbs from Kenwood. The correct bulbs have a thin green cover over the bulb to provide the correct color.
Part number from Kenwood parts (east or west, find them on Kenwood's website)
is 830-0845-05.
Order a few, and stash them away. They are used in a few other Kenwood rigs.
The front panel comes off easily. You need to remove the knobs, and if I remember
correctly, there is a hex nut (metric) on the tuning knob.
After you take the top and bottom shells off the radio, and the knobs, there are a few screws
on the left and right that allow you to tilt the front panel forwards to get to the bulbs.
Good Luck!!!
...Dave

4377. Re: Looking for 8 conductor microphone cord

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-16 17:48:54 UTC
From: "Bob M." <xxxxx@yyyy.zzz>
Message-ID: <LZSdnfO-XZTsJSqi4p2dnA@comcast.com>
Source record: 25450

The Icom IC-208H mike uses an 8-pin RJ-45 connector, and the radio, when mounted away from the operator, requires an optional mike extension cord, which I'd hope extends all 8 wires from the mike to the radio. The original short mike cord has an RJ-45 at each end, so the longer extension cord may end up just replacing the short cord, or it may be a true extension cord, with a jack at one end and a plug at the other end.

When I worked at Icom America I went to the factory for that
information and it was in the tech support files there though they
have been archiving to older product files lately. But I seem to
remember your measurement is quite right. that output is quite low.
Icom never produced a monitoring scope. Others did, There was a
company in atlanta that did produce a scope that used that port
however it was far more popular with the R-7000.

4388. IC-Q7A replacement?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-17 15:15:45 UTC
From: joel <jeeez@hotmail.com>
Message-ID: <BC5ub.62846$Mc.10105@twister.austin.rr.com>
Source record: 25461

I've spent several years trying to figure out how to make this IC-Q7A scan the 2meter band and have never been close as far as I can tell. Many, many sessions reading the manual get me nowhere. Either the designers of the controls or I am braindead, one or the other.

So, to do this I need a unit which can be programmed to scan a band, from a programmable start to end frequency. I'd appreciate some recommendation on units which can be made to do this.

Thanks, Joel
(please reply here, the email is no good due to spammers)

Hi,

Do you remember the marvellous electrogolden plate badges ?
For memory http://www.astrosurf.com/lombry/Radio/badge.jpg and
http://www.eham.net/reviews/detail/2668

Many many amateurs asked me where to find now such badges... sorry but
nowhere ! But...
I am currently in the way to conclude new "contracts" with US company very
interested in this business. At least three of them would like to
commercialize such badges (custom die, 24k gold, electroplate, engraved in
blue navy, 5 lines for text, pin/flap on back, etc), but this is still under
discussion.

First of all, I would like to know if YOU should be interested in buying
such a product, price about $70, delivery time about 8-10 weeks.
I do not need your name or any order but simply an idea of the number of
people or club station that such a product could interest at short delay.

To avoid spam, send you feedback using my website form :
http://www.astrosurf.com/lombry/post.htm

Thanks in advance

Thierry

Dean -

You are in luck.
Molex just started production of the old Cinch / Jones connectors.
Give Mouser or your local Molex dealer/distributor a call.

Hi folks... Want to wake up this venerable old radio and use it for some packet work... Was wondering if anyone out there had information regarding this radio.

I'm interested in the power output of this radio. I'd like to compare the design specifications with my currently observed power output.

I'm curious as to why the channel selector runs 1,2,3,4,5,6,A,B,C,D,E,F. Why numerals 1-6, and then letters A-F?

I'd like information regarding the layout of the crystal sockets. When I install the new crystals, It'd be nice to know where to put them...

Any information would be greatly appreciated. I suppose I could just pay $10 or $20 for a photo copy of a manual, but I guess I'm just a cheap S.O.B....

According to an ad in the June 1972 issue of 73, it has "15 watts
minimum output" (at 13.6VDC).

It has sockets for 12 receive crystals, and sockets for 6 transmit
crystals.

This rig dates from fairly early in the 2M FM boom. There wasn't the
level of standardization, and there weren't so many repeaters. So at least
some rigs made it easy to use a crystal more than once. For instance, .94
was a common simplex frequency, but .34/.94 was also a common repeater pair.
You might want to use that receive crystal for both combinations,
while switching in the other transmit crystal. So you'd get
more switch positions than crystal sockets, and some means of jumpering
to put the same crystal in more than one

That's the case with this rig. If they went from 1 to 12, it's not
as clear which of them are reworking the transmit crystals. Obviously,
the letters make it clear that you are now recycling the transmit
crystals. (And thinking about it right now, it doesn't fully make
sense. It seems more likely that you'd want to reuse the receive
frequencies, so you'd want more transmit crystals, to allow for
transmitting on .34 and .94 with that .94 receive crystal.)

Internally, there must be some means of strapping the crystals
to go with the switch positions. I never had one of those, so
I wouldn't know the details.

Look inside. Maybe the sockets are marked on the circuit board.
It may at least be clear that that there is a bank of six sockets,
for transmit, and 12 sockets for receive. And if you have any crystals
inside, they likely provide some information about which are the transmit

and which are receive.

I am going to make a guess at this.
They appear to be crystals from one of the early semi-synthesized CB
radios (Robyn maybe??) perhaps manufactured around the late 1960's
early 1970's. The early CB's (such as the Johnson Messenger I & II)
needed a receive and transmit crystal for each separate channel. They
developed a process where they could use 10 crystals, as I recall, to
give 23 channel transmit and receive. Of course this is before the 40
channel units became availalbe.

Part II. - Good news !

Until 2003 no more company provided metal badges, either silver or golden to amateur radio. So I asked to several craftsmens if they were interested in engraving ham callsigns on a 24k-gold electroplated badge, including a logo, text in blue navy with a pin or a flap on the back, like the samples displayed in the URLs listed above.

Today I am happy to inform you that at least two new companies have accepted the deal for about $70. The others accepted also but they need a sample (custom die) to make a master.

I suggest you to make a deal with the two next companies :

Public Safety Logos that, instead of showing an amateur station inserts the seal of your state or another logo (color elaminated) at center of the badge (like police badge if you want). There are three options : a deposit of 22k+ fine gold electroplate on base material for a rich bright appearance; Hi-Glo, a base material which has a golden color throughout and requires no surface plating, highly polished to a brilliant luster, a clear coating is then applied to enhance its durability; and at last VHB Karatklad, that is an heavy gold electroplate, the ultimate in fine gold plate. This process applies a uniformly thick coating of tarnish proof karat gold, purer and more durable than gold plate.

United Emblem that can reproduce the badge as it is displayed in the previous links.

Hope this will satisfy many readers, individuals or clubs.

PS. Today, after have published only one message, already a dozen amateurs from K, G, F answered positively to this news.

Your feedback will be welcome.

Thierry

The PIC STV5730A on screen display project board provides a simple platform for text over video applications. It is ideal for creating on screen displays for ATV applications such as callsign generation.

The unit offered for auction is a demo unit. There is some minor cosmetic damage to the enclosure.

Hello !
I'm looking for any circuit to control my yaesu FT-857
I don't want to buy the CAT system box, I want to build
the interface.
The main purpose is to control the radio with the logging
software I use (DX4win and CT).
If you have the circuit or know about any web page where
it might be please send me an e-mail.
I've search a litle on the web but mostly I find are
advertisements about radios with CAT system, not the interface
wiring !

Thanks !

Source record: 25493

I recently acquired a "dead" Ft-990.

I got the receiver running and found I had a bad T/R relay, got that replaced, now I have 100++ power out on all bands no matter where the RF Pwr knob is set. I have come a long way from a dead transceiver, but the rig is still unusable as is since the output cannot be adjusted. I did see a voltage change from ~-6 volts to about +.3 volts at a test point shown in the service manual. I thought I'd drop a quick note in here to see if someone may have run into a similar issue with the 990 in the past. I THINK the problem is on the RF card, but am not sure. The service manual is great for schematics and part numbers, but is seriously lacking in theory.

Anyhow, any help / suggestions would be great. remove the "spam" to email me directly, if you like.

Source record: 25494

Hi all,

Simon Brown HB9DRV and I, have now finished beta testing
on Ham Radio Deluxe and release v1.0 is available as of now from:

http://www.hb9drv.ch

Rigs supported (at the moment) are:

Ten-Tec: Argonaut 516,
Yaesu: FT-100,FT-1000MP, FT-1000MP, FT-817, FT-847,
FT-857, FT-897,
ICOM: IC-703 IC-706, IC-706MkII, IC-706MkIIG, IC-718, IC-735,
IC-7400, IC-746, IC-746Pro, IC-756, IC-756Pro, IC-756ProII, IC-775DSP,
IC-910H,
Elecraft K2,
Kenwood TS-2000, TS-450S,TS-570, TS-580, TS-690S, TS-850,
TS-870, TS-950, TS-50, TS-60, TS-140

You will find more info about this software on Simon's site

The Ham Radio Deluxe suite of programs contains the following
components:

Ham Radio Deluxe - a CAT control program for your radio
PSK31 Deluxe - a sophisticated PSK31 program which includes
SuperBrowser.
SuperBrowser allows you to monitor up to 40 (!) QSOs at a time - the
main
restriction being the available processor's speed.
Mapper - an amateur radio mapping program which can not only be used
for
making your own maps, but which can capture and display Maidenhead
Locator
info from the PSK31 Deluxe screen.

Ham Radio Deluxe also supports speech announcements and alarms, but
you will
have to have Microsoft's TTS files installed on your computer. You
will need
to visit the Microsoft website to download and install a total of
about 8MB
(in two files) for this option if the files are not already installed.
The
URLs are:

http://www.microsoft.com/reader/downloads/pc.asp for the Microsoft
Reader

and

http://www.microsoft.com/reader/downloads/tts.asp for the
Text-to-speech
module

We advise the use of WinXP or Win2000, but many of our beta-testers
are
using Win98 or Win98se, and there's one poor benighted soul using
Win95 (NOT
recommended!)

Hello,

I'm looking for information, cabling, software, and other materials to program the Motorola T5600 desktop controller. If you could post/forward any help or information I would really appreciate it.

Thanks, Tom

4423. FT857 vs. IC706MKIIG

Hi OMs,
Can anyone compare these two radios? I look for some little, mainly HF radio, in my new very limited space of life :-(
Up till now I've used FT990 + home brew 400 watts PA. I prefer DX-ing (CW & SSB)and I hope to work the last 2 countries (3Y0/B and VU4) using some of these little rigs.
Thanks for the serious advice,
George, SP2BRZ.

Your best starting spot: Motorola's parts department, 1800-422-4210. Best to start with Parts Identification so you can pin down the correct documentation for your unit.

Fair warning: The RSS (Radio Service Software) packages can be costly. The one for the T5600 could run anywhere from $75 to $300, depending on how Motorola wanted to price it.

Happy hunting.

I recently got a IIG and have spent time using all the features to get familiar. I am ok with it. Some of the menu operations and arrangements are not to my liking, but I think that is to be expected. Everyone thinks differently. Can not comment on the 857.
The only thing I found "wrong" is that the IF shift is backwards on all bands. Icom US says they'll forward info to Japan.
Though not wrong, I prefer tuning CW in the "upper" mode - that takes putting it into CW-R and cranking the IF shift full CCW (down).
Finally, switching between upper & lower sideband, the filter centering is not perfect. This is probably common for all rigs and dependent upon factory adjustment. This is not noticable by ear, I did some accurate measurements for the IF shift issue and did the sideband check for the heck of it. (I did the 3dB points of the filters I have for both upper & lower. - SSB-W & CW 500Hz.)

Try some questions about specifics you are interested in. e-mail would be better as I read this NG infrequently. My call at arrl dot net.

When I worked at Icom we saw a few that acted like your Yaesu does. On
the Icom's it was almost always the Power Amplifier was oscillating.
When that happens no power control adjustment is going to help. Some
of the times it was a transistor in the receiver switching circuit
that was causing the oscillation to happen.

Just a thought, I know Icom and Yaesu are not the same but I would
suspect circuit designs are not that dissimilar.

Hello George:

Go with the FT-857. The receive audio blows the Icom 706 MkIIG away. Ive owned both radios and have done side by side comparisons. There is a huge difference from a "radio" perspective.

The menu system on the Icom is somewhat more logically designed than the Yaesu however Im more concerned with the TX/RX capabilities of a radio as compared to the stupid toys that hardly anyone uses.

PS: I use an FT-990 w a Clear Speech DSP and a small amp at the home QTH and I wouldn't trade the combination for anything (at least for now).

Thanks Gary,
I never even considered that. I did have to replace the T/R relay, it was stuck in receive. I scratched my head over that for a while... 20Amp current draw, and NO output.. Anyhow, got that replaced. Maybe the transistor that drives that relay needs replaced as well..

The -6 is the clue. It is a reference for the power control circuit and when
it goes away so does the control. At least on Kenwoods and Icoms.

4438. New amp available soon

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-20 15:35:58 UTC
From: Ken Bessler <kg0wxIHATESPAM@yahoo.com>
Message-ID: <bpin0t$1p5us2$1@ID-213023.news.uni-berlin.de>
Source record: 25361
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

HF Pack's K5OOR amp build IV is nearing it's release
date. The amp accepts 1-2 watts drive to produce 35-40
watts output. The amp runs class AB and is bandswitched.
Operates 160, 80, 75, 60, 40, 30, 20, 17, 15, 12 & 10
meters. New to build IV is tha addition of 60 meters.

Cost of the amp is only $122 for the complete kit. You
can see details for this project at:

http://www.hfprojects.com/

Pictures of the amp are at:

http://www.hfprojects.com/v2/modules.php?name=Content&pa=showpage&pid=1

Note: This project complys with FCC Regulations
97.3(a)(19), 97.515, and 97.317. Recently, K5OOR
built and tested such an amplifiers under 97.315(b)(3)(i).
It is understood that this activity was consistent with the
Regulations.

Currently, the group is waiting for a few more ops to sign
on to the project - we need a total of at least 100 members
to order the parts. Currently we have about 50 signed up.

Also, I read somewhere that this may be the last run for
this series so you may want to jump on the band wagon
before the chance slips away!

After this project is gone the only bandswitched legal QRP
drive amps will be the ones like the Tokyo High Power
HL50B ($300+ for 50w).

So join our group and have the pride of announcing to
the other end of a QSO that you are running a homebrew
amp!

Maybe I'm mistaken, but aren't commercially made amps subject to some limitations, like it can't have the ability to work 15 - 10 meters out of the box (The user has to enable that ability) and aren't they required to use a higher input to work?

Or is that only limited to amps of a certian output and higher? I noticed this amp does 35 - 40 watts (A QRP amp, obviously)

> http://vhfradiobuff.tripod.com

You're not mistaken. The THP amp *is* a commercial
amp but the K5OOR amp is NOT. It's a kit, and by
FCC regs you can build one a year for your personal
use. Now as to commercial amps, I believe the regs
atste that it must have a drive requirement of 50 watts
minimum and can't work 10 meters out of the box (15
meters is OK)

Virgil, K5OOR, might be able to clarify the matter
further as he seems to have done research on it.

Opinion from the FCC on the project:

An opinion from the FCC was sought concerning conformance to the rules and
regulations. Here is their response:

"The main question in your letter seems to be whether a group of amateur
radio operators may pool their need to buy electronic parts and components
so that each member of the group may build a project for their amateur radio
station. The project is an amplifier that could be used with QRP
transmitters to increase the station power to 35 watts RF output.

Section 97.315(a) provides that no more than 1 unit of 1 model of an
external RF power amplifier capable of operation below 144 MHZ may be

constructed or modified during any calendar year by an amateur operator for use at a station without a grant of certification. The intent of the rule was to accommodate amateur radio operator's desire to be able to build one amplifier per year, or modify one amplifier per year, for use at his or her station, but to prevent an amateur radio operator from mass marketing amplifiers.

Based on the description of the project that you have provided, because the amplifiers are being constructed by members of your group individually, they would be permitted under this rule. The rule does not prohibit a group of individuals from coordinating the purchase of parts to obtain a better price, or otherwise address how parts are obtained. Rather, it allows construction (or modification) of one external RF power amplifier per year capable of operation below 144 MHZ, provided this construction or modification is done by an amateur radio operator and the amplifier is for use at a station.

The rule section you inquire about, Section 97.315(b) applies to any external RF power amplifier or external RF power amplifier kit manufactured, imported or
modified for use in a station or attached at any station. From your description of the project, it does not appear that the coordinated buying or distribution of parts among members of the group results in an external RF power amplifier kit that is "manufactured, imported or modified for use in a station." Rather, the amplifiers are being constructed by amateur radio operators for use as part of their amateur radio stations and, therefore, my view is that Section 97.315(b) does not apply."

Hope that helps Andy....

A new version of APRSPoint is available. It incorporates a lot of new changes and enhancements and works with both MapPoint 2002 and 2004. MapPoint 2004 was just released by Microsoft and is available as part of the package. It contains lots of new additional map data for North America and Europe. You are welcome to visit http://www.aprspoint.com/ for details. Thanks.

Hi,

Order your radio amateur callsign engraved on 24k gold electroplated badge !

Yes, the business starts again ! After WestId gave up this business, United Emblem accepted the deal, but...

To make this deal a future business for this US company, I need to find 15 radio amateurs, individuals or clubs, who would accept to order their callsign engraved in a 24k gold electroplated badge.

Do reserve it now and pay only once I have gathered all 15 orders.

Cost $99 plus $15 for charge worlwide. I will do all my possible to reduce the price below $80 + charge.

The first 15 orders have to pass via my intermediate. I take no fee in this transaction.

Check on : http://www.astrosurf.com/lombry/qsl-badge.htm

<< I'm curious as to why the channel selector runs
1,2,3,4,5,6,A,B,C,D,E,F. Why numerals 1-6, and then letters A-F? >>

Raymond-

I had the HR-2A back in the 70s. It was one of the early solid-state Two Meter rigs. I don't think I have the exact information you need, but thought I would pass along some recollections.

1. The transmit crystals are in the 6 MHz range. The later HR-2B model had a multiplier chain with different multiplier ratios, using 8 MHz crystals in an attempt to increase drive. It seems that there is an instability that causes out-of-band spurs when drive isn't high enough. Unfortunately there is also an SWR protection circuit that reduces drive if SWR is high. Naturally the out-of-band spurs will have higher SWR when loaded by an antenna tuned to Two Meters, but not when loaded by a dummy load in the shop! (This isn't normally a problem with the HR-2, but is extremely serious with the Six Meter version, HR-6.)

2. There was a modification kit, maybe offered by another company, that added six additional crystal sockets and trimmer capacitors for the transmitter, to enable the full twelve channel transmit capability. The channel selector switch already has the terminals for the additional crystals.

3. One weak component is the channel selector switch. It develops bad contacts after much use. I recall using mine almost like a scanner, and wore out two sets of switches. The switch wafers can be replaced without replacing the other mechanical switch components, although disassembly is necessary.

4. The circuit boards are very similar or nearly identical to an early version of the Regency BTH-201 commercial VHF High-Band transceiver. I believe the commercial version may have used a higher-powered transistor. It used push-buttons rather than a rotary switch for versions with more than one frequency. (The HR-6 is similar to the commercial BTL-301.)

5. Receiver sensitivity is not very good by today's standards. Back then, there were at least a couple dual-gate mosfet preamplifier kits offered by other companies. They increased sensitivity from around 0.35 microvolts to around 0.2. Of course the radio becomes more susceptible to intermodulation interference when the preamp is used.

6. As far as I can tell, the company that was Regency was split, with the scanner portion going to Uniden and the commercial two-way radio portion becoming RELM, located in Melbourne, Florida. I doubt they can provide much information about the HR-2A, but it might still be possible to obtain service information about the commercial BTH (and BTL) series transceivers.

7. In recent years I have heard of several HR-2/2A/2B/2S/212 radios being used on packet. They apparently work OK in that application. The only problem I can think of, is knocking the audio level down far enough to keep from over-driving the microphone circuit. The HR-2/2A/2B/2S/212/6 used a high impedance ceramic microphone element.

I spent a LOT of hours working on the HR-2A (and HR-6). If you have any specific questions, I might be able to recall something that would help.

Thanks Fred! Sure appreciate the info. Tried an impromptu test here
the other night, seems that every time I the rig tried to connect to
my test rig (laptop with baycom modem), it would trigger a restart on
the TNC. Hmmm, think maybe the fact that my test antenna was a 1/4
wave vertical stuck to the back of the HR-2A with the TNC right on top
of the radio had much to do with it? Tonight I try plugging one of
the outdoor antennas into the Regency!

Source record: 25380

I have a Connex 3300 radio that i am willing to sell. The radio is in good working condition. It has a roger beep installed, with a switch for it on the right side of the radio. It also has a toy that honks a semi horn 2 time then says "Hey get out of the way stupid!". I have a road king mic for it. It will aslo come with a midland external speaker for it. The radio has Am/Fm band and PA. It has 240 channels.
I had it listed on E-bay and the auction was ended, becuase it is a problematic radio since it is considered a 10 meter radio. But if you are intrested in buying it feel free to E-mail me at "mrnmrscody@aol.com". The radio is about 6 month old, unfortunatley my house burned down sept. 26 and I do not have the original box or paper. Radio was saved since it was in my big truck! I hate to sell it but with everything going on in my life I am forced to sell it.

5.1) JAN Crystals
JAN Crystals
2341 Crystal Drive
P.O. Box 06017
Fort Myers FL 33906-6017
+1-800-JAN-XTAL (Monday through Thursday)
+1-813-936-3750 (FAX)
+1-813-936-2397 (plant)

They make crystals. Minimum order is $10, which might be one crystal, or might be two.

Didn't see a web site either, but here is what was listed. G.W.

It's not much of a website, but it would seem to be http://www.jancrystals.com
But that is an assumption. It shows up in a websearch, and the URL
would seem to fit and they do make crystals, but I don't see
an address to verify that it's the same crystal.

Michael

<< Any idea where I
could set a set of crystals for this thing? >>

Raymond-

Using Google, I found Jan at http://www.jancrystals.com/. I also found http://www.crystek.com/ and http://www.icmfg.com/.

The transmit crystal is in the 6 MHz range, parallel resonant, f/24. I don't recall the load capacitance.

The receive crystal is in the 45 MHz range, (f-10.7)/3. It is an overtone crystal that is series resonant minus a few Hz. It is the same as was used in the Regency crystal-controlled scanners of the 70s. The old Radio Shack scanners may have used the same crystal formula, but I'm not sure.

The stock 455 KHz ceramic filter used in the HR-2A was broad as a barn, so receive crystal accuracy was not very critical. However, there was a modification kit that replaced the ceramic filter with one that had a narrower bandwidth. If your radio has the commercial filter, then the receive crystal must be much closer. There is no receive frequency adjustment. The commercial filter is longer, and fits the second set of holes on the PCB.

I did not catch my error in logic regarding microphone sensitivity. It seems that high impedance microphones usually have higher voltage output than low impedance microphones. Therefore it should be EASIER to match between the microphone input circuit and the output of a TNC.

73, Fred, K4DII

PS: Did you know your @arrl.net address doesn't work?!

Beg to differ, it was standard on the 820S and a dealer/owner installed
option on the 820. It was a plug and play deal.

You've got that high frequency cavity oscillator, that runs from 256 to 512MHz, which is successively divided down for the lower bands. When I was working at Rockwell-Collins, those 8640s had a sticker on them, stating that the unit needed to be on for at least 72 hours, before making any measurements. They do take awhile to stabilize.

Ooops, guess I was confusing the DG-1 and DG-5 a little, but still, neither was a kit requiring assembly, just installation. From time to time people part-out TS-820s and that might be a source. The 820 is a fine rig.

I'm passing this info along because I thought it was important for the group (and before someone damages the radio they worked so hard for). The below email was a response from an ICOM tech after an amateur op inquired about the performance of the 746 and 746 Pro on 60 meters. Take the info for what its worth.

73 de Paul

Good Morning....

Thanks for your e-mail.

The 746 final PA band pass filters were never designed to support operation outside of the amateur radio bands. They will "stretch" to accept normal operation in the MARS and CAP frequencies just above and just below the amateur radio spectrum, but they will not support operation down in the 5 MHz area. They will heat up and you will damage the radio. About the only two radios will have reasonable operation on the 5 MHz area are the 706MkIIG and the 718.

Best Regards;

Mike Hilton

The buyer winds the inductors. Not to worry, though - the
instructions are easy to follow and well written. You can
download all the instruction manuals from the HFpack site.

http://www.hfprojects.com/modules.php?name=Downloads&d_op=viewdownload&cid=1

Basically, an example would be - pick x colored torriod, cut
x inches of enamled wire, wind x turns. Simple!

> Bob
> k5qwg

Morning, Bob - I emailed K5OOR Virgil with your question but
in the mean time I looked at the schematics. The incoming signal
is fed through an attenuator. This attenuator (r2, r3 & r4) can be
set up for specific rigs. Here is the matrix:

DB R3 R2 R4 IN OUT RIG
3 300 18 300 2.0 1.0 K2
4 220 24 220 2.5 1.0 FT-817
5 130 43 130 3.0 1.0 Other

As you can see, the amp really needs only 1 watt of drive. It
would be very simple to make a pad to attenuate your 5w
down to 1w. A 6db pad would take 4w down to 1w but
5w would be 1.25 watts, a little much so I'd go with a 7db
pad - according to my math that would be just right.

Hope that helps,
Ken KG0WX

Hello,
I have a clean (non-smoker) Kenwood TS-450S with the original manual,
Serial Number 40900012.
** Modes: AM, FM, SSB, CW, RTTY, True FSK.
** 100 Memory Channels
** General Coverage Receiver 500 kHz to 30 MHz.
** TX - 160m, 80m, 40m, 30m, 20m, 17m, 15m, 12m, & 10m.
** Accessories:
Hand Mic & Power Cord.
YG-455C-1 500 Hz CW FILTER.
YK-88CN-1 270 Hz CW/RTTY FILTER.
YK-88SN-1 1.8 kHz SSB FILTER.
MB-430 MOBILE MOUNTING BRACKET (USED ONCE ON VACATION).

This is a great radio, SUPER for contests with filters it has! I have
the mods available, but they have never been done. I bought a new IC-746
for the DSP and need to find my Kenwood a loving home. The filters alone,
cost $390 new.
All this can be yours for only $550 (firm) plus the cost of shipping &
insurance. Can be picked up in centeral Indiana.
If you would like a picture or to read the ARRL review of this rig, contact
me via email.

For Sale Mint approx. 3 months old) Icom W32A Dual
Band 2 Meter/440 HT
Comes with the new box, HRO (Oakland CA)paperwork etc.
stock 9.6 Volt/600 mH-a Battery and wall wart charger.
In addition to the above it includes the following:
4-cell Battery case (Icom BP-170)
6-cell Battery case (Batteries America BP-170L)
a "Pouch" (Pouch 32-5T)
Speaker-Mic (ADI/Prime, I think) fits perfectly.
Also have a programming cable (home brew) and software
All above is new - less than 3 months old except the Mic
and the home brew programing cable.

$275.00

I don't believe you need to build a level converter -- you just need to wire up a cable to connect your PC's RS232 port to your FT-857. The pin-outs are given in your FT-857 manual.

73,

Dave, AA6YQ

Source record: 25317

I just bought an SX-117 and must make room by selling an SX-101A that is recapped and realigned and working well. Some of the knobs need some work. The main tuning knob is not original, and currently the receive/standby switch is serving the on/off function. It has the added RF stage.

$150.00

I live in west suburban Chicago and will drive up to an hour to meet someone for delivery. At this time, shipping is not an option.

Over Thanksgiving I will be traveling to Beardstown, Illinois, and then north through the Quad Cities and Dubuque, Iowa, to Dodgeville, Wisconsin. I'd be happy to deliver along that route.

Please email with questions or offers.

Thanks,

Dave K9SW

Hello all. I have a question. How come with some commercial radios, Tone Squelch only works when the mic clip is grounded, so when you remove the mic from the clip, it opens the receive to everything?

I recently bought a Standard UHF radio for GMRS use and it has this, so my wife can listen for me without hearing other junk, but when she removes the mic (that I had to ground), she hears everything on the freq!

It is so that you will hear the other users. That way you will know not to try and talk while the frequency is in use by others that have a differant tone setting.

If that's the case, then it's opposite in thinking to amateur radio, where a repeater may have a PL decode tone, which will allow you to talk on the repeater, but not hear anyone else on that same frequency. The local repeater here is on 146.910 and another on 147.045. There's other repeaters that often will start coming in on the same frequencies, but if you have decode on, you'll never know you're transmitting while others are talking on the other repeaters.

Source record: 25323

HI:

GP300 / P110 Clone Program Cable (Ex cond)

Tired of the alligator clips ?

Ever smoked / corrupted your radio with one ?

I have made a few " Premium Grade Clone Prorgam Cables "
for the P110 and GP300 (Works on both of them)

The Battery Housing holds a Exact replacement Pogo Pin, a
9 Volt DC battery along with a Heavy Duty Industrial Battery
Snap has been added, in addition to the housing has had a
few special mods to " Prevent the pin from being damaged."
when this is used to " Secure " the Program fixture in place.

Which is generally what breaks since many times , that
mod is over looked.

A bit pricy, but designed to give years of service.

The use of " Hold on wires ", Alligator Clips, Rubber Bands, is a
sure way to corrupt a Radio Code Plug

A photo can be seen @

http://www2.4dcomm.com/metrotech/p110_c.jpg

95.00+6.50 Pirority Mail S & H (Battery is included)

This just slides on just like the battery, but is
a program cable (Requires Rib Box)

==========

Many other program cables made by request:

All very high quality ! (Not all cables are made the same)

Want to see a few ?

This is some of the ones we have seen sold on some Auction Sites:

http://www2.4dcomm.com/metrotech/bad_cbl.jpg

This is how we make ours

http://www2.4dcomm.com/metrotech/my_cbl.jpg

X9000, Saber , Astro-Saber, XTS, MTS, HT1000 , HT600 / P200, Spectra (High & Low Power), Maxtrac / CDM . Pro Series, EX500 Series , and just about any Motorola Cable !

We make cables that are equal to, or better than factory spec.

Please feel free to email me anytime

Monty

Ham radio is opposite of most comercial thinking. On a local ham repeater most hams want ot be able to hear all that is going on on the repeater so that if anyone puts out a call he can be answered by anyone for a casual chat. GMRS users are usually only interisted in the other parties they want to talk to and not hear all the chatter on the frequency. That is why the hook switch blocks out the gmrs and also releases the tone decoder when off hook.

Howdy Andy.....Reread what Ralph described to you carefully and, when you
think about it, you'll see that he's described exactly the same reasoning
amateur repeaters use PL tones, with the same benefits and consequences
if their use is misunderstood (a user who, using the correct PL tones,
and is accessing a repeater may be interferred with by another station
transmitting on the same frequency but not using PL tones or who may be
using a different PL tone...of course the difference in signal strengths
received by the repeater will determine the degree of interference).

Maybe some amateur repeaters are transmitting a PL tone....if so I
didn't realize that, and persons in the coverage area could be open to
interference if for some reason they attempted to share the frequency
using a different tone or no tone (and vice versa). The best bet, as
we all (should) know, is to listen first, ensure the frequency is clear,
then transmit.

She is supposed to .. before transmitting .. how else would she (or
anyone) know if there is someone else using the frequency?

Ham radio is different .. if a repeater needs a tone for access it is to
keep distant users of a similar (or same) frequency repeater from
accessing your local repeater unintentially. It is not to keep different
users of the same repeater from hearing each other.

Many different users can access a GMRS repeater. To keep from hearing
unwanted converstations those in your "group" agree to use a specific
tone. So you only hear 'calls' from your group. But the repeater may
already be in use when your group tries to make contact. Listening without
a tone is the only way to be sure you are not interfering with another,
ongoing conversation.

To put it another way .. assuming that your HAM repeater passes tones.
Would you set up a tone with a fellow ham for use on a non-tone required
repeater? If you did, then you would not hear any other traffic on the
repater except your firend. If you didn't listen without a tone first,
before transmitting, you'll eventually end up stepping on an existing
conversation on the repeater ... and making folks really, mad at you!

Richard in Boston, MA, USA

Quite a few repeaters here in SCV-land do put a tone on their output
(almost always the same one they use for their primary receiver).
There are a couple of reasons for having tone-squelch turned on, on a
mobile rig using these repeaters:

- There's quite a lot of QRM on certain 2-meter repeater output
frequencies - commonest cause seems to be leakage from improperly-
installed cable TV systems in homes and apartments. It's often
strong enough to unmute a rig driving through the area of the QRM
emitter, unless tone-squelch is used or carrier-squelch is cranked
way up.

- We occasionally get tropospheric "skip" from repeaters on the same
frequencies, 100 miles or more away, which use different
(usually county-based) PL tones.

> The best bet, as
>we all (should) know, is to listen first, ensure the frequency is clear,
>then transmit.

Definitely agreed!

My own mobile and HT rigs will show the incoming signal strength, or a
BUSY indication, even if the tone squelch is suppressing the audio...
so "look before transmit" works pretty well with these rigs ;-)
Unfortunately this isn't possible with all rigs, or in an eyes-are-
busy-elsewhere situation.

I am a volunteer EMT on a first aid squad and I never understood why they made it so when the mic was picked up, you'd hear everything. We don't want to hear everything when we pick the mic up. We wanna hear the other EMS units from our area, not some dispatch center 60 miles north of us. With the squelch open like that, sometimes it makes it difficult for us to communicate. With the squelch closed, there's no problem. :(

>then transmit.

The 2 repeaters that I mentioned both allow you to set your radio for tone
DEcode so that you will only hear that repeater. Both of them have other
repeaters coming in when there's the slightest enhancement. Fortunately for us,
our mics don't need to be grounded so the decode function is always there,
squelching out those other repeaters that are coming in and allowing us to
share the frequency.

>She is supposed to .. before transmitting .. how else would she (or
>anyone) know if there is someone else using the frequency?

The whole purpose of setting up the radios with PL encode and decode is so you don't hear the other users of the frequency. Once the mic is off the hook, it makes that feature moot. Years ago, our volunteer ambulance shared a frequency with a bus company. We'd take the mic off the hook to call dispatch and we'd hear things like "Linda! You forgot to pick up little Jonny this morning. His mother is very mad." Of course they were using a PL encode/decode, but apparently it didn't open when they lifted their mics, so they never heard us.

>Ham radio is different .. if a repeater needs a tone for access it is to
>keep distant users of a similar (or same) frequency repeater from
>accessing your local repeater unintentially. It is not to keep different
>users of the same repeater from hearing each other.

We're talking on simplex GMRS freqs, not repeaters. There aren't any local repeaters for us.

Hello to all,

I am looking for a website where a service manual for a Kenwood TS 440
is located in PDF.

I had downloaded it a few months ago, but had a recent computer crash
and lost it.

I believe the site was located in Italy, but could be mistaken.

I have a hard copy of the operating manual, I need the SERVICE maual.

Any help greatly appreciated.

You will find an article that might be of interest to you at the ARRL website. It is called "Everything You Ever Wanted to Know About Computer Interfacing" and is available in PDF.

There is an interface board that can be used for Yaesu, and if you want to buy one it is available from FAR circuits on the web.

I am not familiar with your model of Yaesu, so I don't know if you can hard wire it as suggested or not.

I do know that the interface in this article is easy and cheap to build. I used the interface described in the article for my Kenwood TS-440 with grear results.

If you cannot find the article, or if you are not a member I can send you the file as an email attachment if you like. It is about 1.5 meg.

The reason you hear everything when you pick the mike up is because you are supposed to listen to everything before transmitting so you can avoid interfering with other traffic that may already be using the channel.

Message-ID: <bpt2ecdkr1@newsserver.unipi.it>
Source record: 25342

Hello all,

I'm trying to repair an (ab)used FT-102. Among other things that I'm fixing
I found on the RF-UNIT board the following missing components:

T21, T22, T25
C38, C42, C08, C31, C19
R49

Can anyone tell me if those parts are supposed to be there (I guess they
are) and where to find the missing transformers?

Thanks in advance.

That's a nice theory, but it doesn't work. If we waited for those distant agencies (we're talking 50 miles+) to stop talking before we talked, we'd never communicate. Our local stations don't provide enough interference to keep them from communicating and vice-versa, but it is annoying to pick up the mic and try to talk to someone on their handheld when some other agency far north is stepping on him (we don't use a repeater, it's all simplex). If PL decode was active 100% of the time (instead of only when the mic is on the clip), we'd be able to communicate with no problems since we'd only hear our other units and we still won't be providing significant interference to the other agencies, especially if they did the same.

With any luck, we'll be on the county's 500 mhz trunked system soon.

I have the following items for sale that are excess to my needs. Prices
do not include shipping. I will ship overseas.

Eico 315 Signal Generator...........$45 plus shipping
This signal generator that covers 75 kHz to 150 MHz in six bands. Output
is either a modulated or a pure RF signal. The unit is in nice shape and
works. Includes a copy of the manual.
http://members.cox.net/radiostuff9/eico315.jpg

Heathkit SM-600 Nixie Tube Multimeter.............$40 plus shipping
Nice condition and works well.
http://members.cox.net/radiostuff9/heathnixie.jpg
http://members.cox.net/radiostuff9/heathnixie2.jpg

Book - "The Portable Radio in American Life" ....$25 plus shipping

This is an out of print 260 page book published in 1991 covers the
history of portable tube radios and transistor radios from the 1920's to
the 1970's. Includes historical information on Sony, Zenith radio,
Admiral radio and many other brands who built portable radios. This is
an excellent reference book if you collect portable and transistor
radios. This is a new book which is still sealed in the wrapper. The
photo is of my copy. This is a great radio reference book. I have 10 of
these books.
http://members.cox.net/radiostuff9/portableradiobook.jpg

Kenwood MC-80 Microphone...........$75 plus shipping
This remote tune mike is for use with radios such as the Kenwood
TS-440S, TS-430S and possibly some other Kenwood radios. The mike is in
nice shape and works well.
http://members.cox.net/radiostuff9/kenwoodmc80.jpg

Transceive Cable for Kenwood Twins: R-599 Receiver and T-599
Transmitter..........$60 plus shipping
http://members.cox.net/radiostuff9/kwtwins_cable.jpg

Bird Wattmeter Slugs
All have been tested in my Bird 43 wattmeter.
50D Slug: 200-500 MHz, 50 watts...........$50 plus shipping
http://members.cox.net/radiostuff9/bird50wuhf.jpg
161A Slug: 400-1000MHz, 25 watts...........$50 plus shipping
http://members.cox.net/radiostuff9/bird25wUHF.jpg

Lafayette HB-76 VHF Receiver.............$45 plus shipping
This is a VHF receiver from the 1960's that covers 152-174 MHz. The
unit is in excellent condition cosmetically and does work.

http://members.cox.net/radiostuff9/laffvhf.jpg
http://members.cox.net/radiostuff9/laffvhf2.jpg

Set of crystals for the Navy TDQ transmitter...$110 plus shipping
Their are 24 crystals of which 23 are the original Navy
crystals; one crystal is not. The wooden box is in great shape also.
http://members.cox.net/radiostuff9/tdq_xtals.jpg
http://members.cox.net/radiostuff9/tdq_xtals2.jpg

Heathkit V-6 VTVM.....$30 plus shipping
with a photocopy of the manual and test leads. This is a vintage VTVM in nice shape. The unit works but needs to be calibrated. This is explained in the manual and is pretty straightforward.
http://members.cox.net/radiostuff9/heathvtvm.jpg
http://members.cox.net/radiostuff9/heathvtvm2.jpg

Swan WM-2000 Wattmeter.....$65 plus shipping
This meter covers 3.5 to 30 MHz and measures SWR and power. Power is measured in 2 ranges: 0-200 watts and 0-2000 watts.
This unit is in excellent condition and works well.
http://members.cox.net/radiostuff9/swan_wm2000.jpg
http://members.cox.net/radiostuff9/swan_wm20003.jpg

Swan Model SWR-1 SWR/Power Meter .....$35 plus shipping
This is a 1 KW unit that covers 3.5 to 150 MHz. Tested and working. This is a neat item if you are a collector of Swan equipment.
http://members.cox.net/radiostuff9/swan_swr1.jpg

Sonar LP Filter - NIB E.F. Johnson Clone.....$40 plus shipping
This looks like a clone of the EF Johnson low pass filter however it has

a neat chrome finish. This is new in the box with instructions and mounting brackets. This is a 52 ohm filter that will handle 1 KW from 2-30 MHz.
http://members.cox.net/radiostuff9/sonar_lp_filter.jpg

National Type MCN Vernier Dial - New in Box!.....$45 plus shipping

http://members.cox.net/radiostuff9/mcn.jpg
http://members.cox.net/radiostuff9/mcn2.jpg

Metrotek Mustang Vintage 1960's Tube CB Radio.....$75 plus shipping
Easy conversion to 10 meter AM. This is a 7 Tube Transceiver from the mid 1960's. It has a tunable receiver and 6 crystal controlled channels for transmit and receive. This will work on 110 and 12 volts. The radio works great on transmit and receive. it currently has one channel crystalled up. The power cord included is for 110 volts. It has the original factory
microphone. The inside is clean and unmodified with no signs of abuse or

burned components. It also includes the factory mobile bracket which is not shown.

http://members.cox.net/radiostuff9/Mustangcb.jpg
http://members.cox.net/radiostuff9/Mustangcb3.jpg

Gonset Communicator III - 6 Meters.....$75 plus shipping
This is a separate receiver and and crystal controlled transmitter from
the 1950's . Unit works but needs dial cord restrung on receiver.
Includes a bunch of crystals. The radio has a number of scratches.
http://members.cox.net/radiostuff9/gonset_comIII_6m.jpg
http://members.cox.net/radiostuff9/gonset_comIII_6m2.jpg

Eimac 4-125 Transmitting Tube and Socket.....$60 plus shipping
The tube appears new. I checked the filament for continuity which it
has. The brown color in the glass is a reflection off of the beige
background. The socket is used.
http://members.cox.net/radiostuff9/4-125.jpg

Drake ML-2 Marker Luxury 2 Meter Transceiver.....$75 plus shipping

This 1971 2 meter transceiver has a solid state receiver and a tube
final putting out 10 watts plus. Also has a built-in AC/DC power supply.
This one is in nice condition and works well. This one has the original
crystals for 34-94, 94 Simplex. For more info on this radio visit this
link: http://www.dproducts.be/Drake_Museum/ML2.htm

Wow, what a bargain!

If you search eBay for DX-150 or DX-160 you will probably find the
speaker you seek. The same speaker was used for both models.

Some nice pictures but I have a question...

Who's going to be first with a 100 in 1500 out mobile kit?

Lee Martin's Skywalker is nice but doesn't quite hit the mark:-)

Hi all, if you're looking for a good place to sell amateur radio equipment, like the forsaleswap@mailman.qth.net groups and the like I have one it's on yahoogroups called amateur radio swap to subscribe send a blank message to amateurradioswap-subscribe@yahoogroups.com I do keep a close eye on new members, yahoo accounts and others that are known for spam are moderated for a little while, but really only until I see a legit message from that account. Anyway if you'd like to join come on board I just cleaned a bunch of bouncing email addresses off and would like to see that number of members go back up. thanks and 73

Hmmm, mine works OK! I have made numerous QSOs on 60m
but most were during the first week that it was opened!

Nothing melted in mine.

Message-ID: <bq03ebcen1$8300dec7@news.demon.co.uk>
Source record: 25255

Hi,

I've just purchased a second-hand TM-455E 70cms multimode to use as an uplink transciever for AO-40. It initially powered up okay, and receive worked well. However transmit was "interesting". When the mike-key was released the set would continue to transmit for up to around two seconds. The period of time was not constant, and would depend upon the length of time the mike was keyed. This happened on both FM and USB. I couldn't find any reason for this in the manual, so I decided to do a full reset by holding down the MR and Power keys. The set switched off and I've not been able to power it on since. The fuse hasn't blown, checked that. Tried wobbling the power cable and the cable between the main unit and front panel.

What HAVE I done???

Paul

4536. wtd: EF Johnson Challenger Mobile Radios and Remote Heads

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-25 22:11:10 UTC
From: "D. Schmidt" <n9nlu_REMOVE_THIS_@charter.net>
Message-ID: <vs7l2h9clq2pfd@corp.supernews.com>
Source record: 25256

I'm in need of a few Johnson Challenger mobile radios and remote heads.

These radios can be working or not... looking good or looking like it was in a dump truck.... I need to get at least a couple working units going plus I need spare parts for the few I already have ... so if all I find is parts units, I probably can get a couple units going from a bunch of parts radios.

I need EF Johnson 7151, 7152, 7162, 7164 and 7166 VHF radios and 7171, 7172, 7182,7184 and 7186 UHF radios and I could use a 7175 or 7187 UHF radio.

I also need one or two EF Johnson Remote Control Heads for the Challenger series radios. These are mainly found with the 8600 series radios but some can be found with the 7100 series radios. Part number on this head is 250-8610-501. I need the head, Junction box and junction box to transceiver and junction box power cables but will consider purchasing just the head or just the cables or just the junction box if you only have those separate items.

If you have any of these items, please contact me with your prices. This is all for ham radio projects - so like I mentioned, these do not need to be in great condition.

Thanks

Dave

YET! I think the prudent thing to do is make sure you are running relatively low power when operating on 60M. You are supposed to be running maximum of 50W ERP. I'd think 10 or 20 watts out of the transmitter would prevent over-heating of the band pass filter components.

I've heard of similar delays happening because of faulty electrolytic capacitors in the mike. In this case, there was considerable remote control circuitry in the mike, and the bad caps were causing voltages to hang around when they shouldn't.

Try unplugging the mike and see if it will power up. If so, that may point you to the problem area. If that doesn't help, perhaps there's a battery in the radio that needs to be replaced, or maybe a very large "super" capacitor needs to charge up before the microprocessor will resume normal operations.

4540. RS DX-394B: why 2nd LO buffer added?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-26 02:14:09 UTC
From: Tom Holden <holden_family@sympatico.ca>
Message-ID: <M_Twb.7948$Eq1.987002@news20.bellglobal.com>
Source record: 25260
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.shortwave

Apart from the new pcb, the main electrical difference between the Radio Shack DX-394B and its immediate predecessor, the DX-394A, is the addition of an emitter follower buffer amp between the output of the 2nd local Oscillator (the emitter of the one transistor 44.5MHz VCXO) and the 2nd mixer. The latter is a 2SK210-Y/YY VHF N-channel JFET; 1st IF is injected at the gate and the 2nd LO at the drain.

Why would the designers add the buffer? What performance comparison should I make between the A and the B model to assess whether it would be worthwhile to retrofit a similar buffer to the A model? I can say that I have not noticed any dramatic difference with my usual listening habits.

Tom

This would be a great opportunity to put some LED's in there and then you'd practically never have to worry about them going out on you again. I remember seeing a fantastic article in QST describing how to do this if you need some guidance. I don't remember what month it was, but if you can't find it let me know and I'll look around. Basically all there is to it, is to take power supply voltage (12V) from the radio and put a current limiting resistor in series with the LED (20mA). Pretty easy and a good upgrade if ever there was one.

jason
kb5urq

P.S. I have an old TR-751 for sale by the way if you need some parts. Its not putting out any power but all the other functions work on it. Would let it go for pretty cheap if I could find a good home for it.

The problem is to get the 10-20w out of the radio you may have to shove 100w into the filter, and that's what hurts. You need to monitor the current drawn to determine if there is a possibility of damage.

They obviously wanted to provide some isolation and/or impedance
matching between the oscillator and the mixer. It's a good engineering
practice, but may not have much practical effect. If you don't notice
a difference, then don't bother retrofitting.

Hi,
I have 2 MFJ-286 Speaker mics available for sale. One is new in the
package, the other has been used very little. The MFJ-286 is compatible with
KENWOOD 2600, 205AT, 215A, 315A, 415A, 21A, 31A, 41A, & 3600.
I will take $11 for the new one or $9 for the used one which includes
shipping and handling in the lower 48.
Please contact me at:
W9DEW@qsl.net

Thanks & 73,
Don West, W9DEW

Hi Andy,

Not only will a lot of amateur gear go into 500Mhz, but I have some
commercial two-way radios (Kenwood TK-840) that are legal for operation
there as sold. Programmed with pc software.

$170 each

Looking for an inexpensive 6 meter multmode rig. Brand not important. Older rig (TS 600 , IC 551 etc welcome) Prefer VE land for shipping purposes, but will consider US based rigs if the price is right.

Remove the NOSPAM to reply by email

Regards,
Gordon VE9GC

The oscillator is an emitter follower, too, so I doubt that impedance matching is the objective. What would the increased isolation achieve? Would it preclude mixing of 1st IF energy in the oscillator? Should this be of some benefit for intermodulation products?

I need a radio that can TX on 2m with general RX on 500 mhz. I have yet to find one amateur radio that can do that. The dualbanders all seem to have a top RX range of around 470 mhz and I haven't found a 2m monoband radio that can RX outside of VHF.

Give this man a cigar because he's today's exclusive winner on 21!

The problem is that most modern hams today don't have a clue about what you're talking about because most modern hams don't understand the theory behind bandpass filtration, especially in their own Riceboxes. They actually believe the radios will go from DC to Daylight once opened.

I believe this is the reason why Yaesu, Kenwood, and Icom haven't publicly released the mods to these radios (other than to MARS/CAP members) because these companies know damn well that they'll be performing a slue of warranty repairs on the lot because some jack ass will actually try to use his radio on the commercial AM broadcast band.

I really just need a radio that can TX on 2m (a monobander) and RX in the 500 mhz range. I don't need nor do I want a dualbander for this application. I should have clairified that at the begining, but I guess I didn't really know what I wanted then...

So, does anyone know of any 2m mobiles (NOT DUALBANDERS) that can RX in the 500 mhz range?

So far, Ten Tec is the only one, I know of, offering specifics on
getting on 60 meters. For their rigs, it's a simple software download.

Though I can't speak for the 746Pro I can firmly state that the BP filter
for the 746 DOES cover the 60 meter segment. It is spec'd for 4.0 to 8.0
MHz. Measurements in the lab showed no difference between the current
draw vs output power between 40 and 60 Meters. Assuming your antenna
presents a good match, you should be confident that the 746 will perform
just fine and within specs when modified for 60 meter operation.

I have a nice Icom 761 with the rackmount handels. Have both service manual and operating manual. Also Org double box from icom. Also Heil HMI mic with cord and stand. Has had MARS mod done. And a few other items done during a recent checkup which are documented in the paper work. I would like 815.00 shipped Conus to your door. Radio is very HEAVY... Can provide a pic. Might entertain trading for an HF amplifier. Thanks for looking.

Hi,

I have found another manufacturer that accepts order for $65 only.
Due to a gentleman aggreement, please reserve your badge via my website
temporary.

Check on : http://www.astrosurf.com/lombry/qsl-badge.htm

There's not really any reason for a 144 mhz tr/rc rig to receive in
the 500 mhz range, so it may be a stretch to find such a rig. Dual
banders, working as high as 440-or-so mhz don't find it that much of
an electrical stretch...

Hi,

I am considering the purchase of a Yaesu VX-2R. My main use for it will be as a scanner, and I have seen a couple reviews on ham sites mentioning that the CTCSS is slow to open up. Does anybody who owns one of these find it to be slow.

Thanks for any input.

There is actually - if I don't want a seperate scanner to receive the 500mhz frequencies I want to listen to. Why not have a 2m rig that also has RX capabilities like a scanner?

>There is actually - if I don't want a seperate scanner to receive the 500mhz
>frequencies I want to listen to. Why not have a 2m rig that also has RX
>capabilities like a scanner?

I think you misread his answer. I'd interpret/expand what I think he
was trying to say as:

"A 144 mhz tr/rc single-band rig will probably be designed with
electronics which are optimized for this single task, for both cost
and performance reasons. Adding a wideband receive capability to
this sort of rig would change the technical requirements, and would
probably either increase the cost or decrease the 144 MHz
performance. There may not be enough of a market for this sort of
somewhat-specialized rig, and thus you may find that no
manufacturer has found it cost-effective to market such a product.

A dual-band amateur rig, which has to go up to 440 anyhow, would
need less modification of its design to be stretched to 500 MHz,
and doing might not increase its cost or decrease its performance
appreciably.

Hence, you're much more likely to find 500 MHz receive capability
in a dualband rig, than in a 2-meter monobander."

There's no question that one *can* design a 2-meter rig with wideband
receive. There's no question that this is what you, personally, want.
There seems to be a big question as to whether enough people want that
combination, for you to be able to find an actual, off-the-shelf
commercial rig of this type on the market today.

For Sale: I'm going to be selling either one of my two Hallicrafters stations. Both are in excellent collector condition, and operate like new. Both stations come with all manuals.

Station #1 consists of the Hallicrafters SX-101-A receiver and the matching HT-32-A transmitter, along with the correct model R-47 speaker and a very rare Hallicrafters branded model C-3202TA desk microphone. Price: $750.

Station #2 consists of the Hallicrafters SX-111 receiver and the matching HT-37 transmitter, along with the correct model R-48 speaker. Price: $500.

Prices are for pickup only near Greenville, SC

I have a SOLAR 115 volt 1.04 Amp constant transformer. It does not work. I found that the capacitor in it was open. It appears it was replaced some time ago before I bought it. The failed capacitor is 4uF 350 volt rating. I am trying to find what is the proper value and voltage replacement for this capacitor. An email to SOLAR has gone unanswered.

Can anyone tell me what this capacitor value and voltage should be?

My guess would be 4uF 350volt.
Look down the motor starting cap aisle.
SOLAR might be a namealike. Normally, these things are made
by SOLA.

Well, it eventually did power up, but there was also other damage.
Turned out it probably taken a knock during transport to me. Amongst
other things, three out of the four clips holding the front panel on had
died. Its gone back for repairs to be paid for by the senders carrier.
Hopefully it will be fully functional when it returns. What I should
have done was try it with the mike from my TM-V7E - I'm fairly sure
they're the same.

Ah well, thanks again!

Paul

The capacitor has to resonate the winding at 60 Hz. Stick a capacitor in
it and use an audio
oscillator to check for resonance. Do this with the transformer unloaded
of course.

Use a motor "run" capacitor not a "start" capacitor. Start capacitors
are for intermitant duty.

> monitor the current drawn to determine if there is a possibility of
> damage.

If you are having the above problem, then there's something wrong with
you radio. My 746Pro puts out nearly full power on 60M, as it does on
all other bands with absolutely NO change in current draw. If the default
40M filter was attenuating the 60M signal that much it would sure show up
on the watt meter!

4626. TS-830S Problem

Newsgroup: rec.radio.amateur.equipment
Date: 2003-11-30 19:33:23 UTC
From: ve7fcl@shaw.ca
Message-ID: <a8396388.0311301133.6350a1d8@posting.google.com>
Source record: 25149

After spending two winters in an unheated workshop, my TS-830S is not functioning properly. No RX, no TX. Also, when I first turned it on the frequency LED display lit up and then faded to black. I live in a damp environment, Vancouver Island BC. Is my trusty old 830 ruined?

The final output tubes are lighting up as they should. I'm wondering if there's a bigger issue since there's no RX either.

I was thinking maybe get some contact cleaner and clean all the connections inside where the different modules connect to the main board?

Anyone had a similar experience?

Jim

A freind of mine has a FT-890 that for the first few transmissions the frequency is unstable in both the transmitt and receive modes. After it warms up for a while it seems to be more stable . It has just started doing this a few months ago and is gettin worse.

Are there any known problems with this rig that could cause this ?

For me -- I have found rare (not price wise) Ham items on E-Bay that I have never seen here.

Example Kenwood made an outstanding grid dip meter -- found on E-Bay thru a notice here. Took 2 years to find one.

I have an HF Swan large swr meter -- wanted the matching VHF unit -- found on E-Bay thru a notice here. Never saw one anywhere in the last several years.

Another is a Kenwood TS-811 for 440 MHz -- not many sold I suspect but have seen a few on E-Bay.

So go ahead and post your FA E-Bay items here -- who knows one might find a Knightkit OceanHopper by this means.

Because, Al, this is an "equipment" discussion group, NOT a For Sale group. For Sale discussion and postings belong on rec.radio.swap instead. Most if not all hams read both. There is no need for this duplication on this non-sales related group.

Why the heck not? As long as one uses FA in the subject line.
I know some folks are touchy about things like that.
I picked up a Yaesu FT-847 on Ebay via a post here.
I paid $675 for it on ebay about a year ago.
The rig is flawless and works great!!
Keep the ebay posts coming!!!

Jim,

Yes, I had a similar problem with one of my TS-830s rigs but to a lesser degree. The problem would occur like yours, then the display would come on, frequency would be irratic for another 20 minutes or so. This is the classic Kenwood grounding problem cited in the QST review of the TS-830S and also described by Rich Measures (AF6K?). Solution is to tighten all screws holding PC boards to the frame and attaching a ground wire to the AF/AVR board (Rich Measures website has step by step instructions). Not sure if this is related to your problem or not.

73s,

Evan

At least some 740's were delivered WARC ready (mine was).

The 740 is a terific rig. With the proper filters (FL44 SSB and 250Hz cw, FL53, I think) they will stand with the best, even today. Before you ask, I believe the "A" versions of the filters are backward compatible. They're shorter, but otherwise the same, I think. Someone may wish to comment on this.

Dear Judges, Lawyers, Policemen, Guards, Counselors, Taxpayers, et. al.,

We are here. Like it or not, for good or bad, we are here. Who are we? We are the downtrodden and dispossesed, the self-torturing, the disenfranchised convicts, drug and alcohol addicts, the unemployed and unemployable. We are the children of poverty, financial and spiritual. We have and will have children of our own, grandchildren too. We are ex-cons, uninsured, homeless, of many colors and speaking many tongues. We are the enemy in what has become a domestic war against ourselves.

And who are you? You who like the tough talk of Tough on Crime? You who watch as budgets are cut in education and health care while you militarize a police force? Bullet-proof vests, automatic weapons, helicopters, tanks, robots ... the testosterone is oozing through the streets, more prisons, longer sentences, tighten the belt, spartan conditions, task forces, gang units, gun courts. And what is there to show for it? Unemployent stays low because half the population oversees those "out of the workforce", the dregs, the rabble, the enemy? Please tell me there is a deeper reason. Do you feel safer? More humane? More like a cohesive society with a shared sense of purpose, who can identify Us and Them? Do you live in a gated community or gentrified neighborhood? By the way, have you read the Declaration of Independence and US Constitution - or do you only know the first phrases?

It's about time we got together. Please know that I have yet to meet a convict who wants their child to be a thief, an addict, a dealer, a prostitute, or a violent individual. Most of us still have hope for ourselves even when stuck in the darkest dilemmas, ruts and catch-22s. Most of us believe in crafting laws and instilling order. Many of us have burrowed beneath the surface to find a spiritual sense of being, an understanding force at least as powerful as those we succumbed to, and many of use wouldn't escape if you opened the front door. Did you know that approximately 10 million Americans are either incarcerated, on probation, on parole or once were in those categories? Each of those 10 million have families, friends, neighbors ... and so closer and closer does the We interface with the You. Don't you think it's time we talked?

Are you ready? Can you accept that the road we are travelling points toward a grim and painful future? Do you have the heart to face monumental failures while bravely struggling beyond where we are now? I know that some of you are, and that some of us are, and this is what gives me hope. You need our insights just as we need your structure. It is never over, especially when a real solution, a real treatment for our sickness, is yet to begin.

In Solidarity,

Bruce Reilly (a.k.a Bruha)

or (if moderated) a different moderator or set of moderators.

6) Votes MUST be explicit; they should be of the form "I vote for the group foo.bar as proposed" or "I vote against the group foo.bar as proposed". The wording doesn't have to be exact, it just needs to be unambiguous. In particular, statements of the form "I would vote for this group if..." should be considered comments only and not counted as votes.

7) A vote should be run only for a single group proposal. Attempts to create multiple groups should be handled by running multiple parallel votes rather than one vote to create all of the groups.

The Result

1) At the completion of the voting period, the vote taker must post the vote tally and the E-mail addresses and (if available) names of the voters received to news.announce.newgroups and any other groups or mailing lists to which the original call for votes was posted. The tally should include a statement of which way each voter voted so that the results can be verified.

2) AFTER the vote result is posted, there will be a 5 day waiting period, beginning when the voting results actually appear in news.announce.newgroups, during which the net will have a chance to correct any errors in the voter list or the voting procedure.

3) AFTER the waiting period, and if there were no serious objections that might inv

All good advice. Also remove those little plastic plugs on the boards.
Eyeball for corrosion or wetness. Clean as needed and spray with a good
quality contact cleaner.

4652. Question -- Yaesu FT-897 power supply

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-01 17:29:10 UTC
From: Bob Miller <bxmiller@texas.netNOSPAM>
Message-ID: <hmtmsvoq71ajee08jng81s9l0q6lfpvfga@4ax.com>
Source record: 25174

I'm considering buying a Yaesu ft-897 for fixed station, home use.

The QST review says there is a space inside the 897 enclosure for a Yeasu AC switching power supply. My question is whether the 897 will accept DC from an external power supply -- I already have a 30 amp Icom power supply -- or must I use the Yaesu internal supply?

The rig looks like a pretty good buy at the current $700 or so, after rebate. But if I have to spend another $200 on the internal supply, that's not so good.

Thanks,

Bob

Well, I've seen computer stuff, hifi stuff and even guns for sale
in the boatanchors newsgroup. Plus they get a lot of stuff that really
does not qualify as boatanchors, it being too new and too light to qualify.
I'm pretty sure I've seen computer stuff sold here in .equipment but
it's been a while.

Source record: 25183

rec.radio.swap is the place to buy, sell, swap, note an auction and just plain give away stuff.

rec.radio.amateur.equipment is a forum to post info, questions, and answers about equipment -- such as performance, troubleshooting, operation etc --- NOT for buy, sell, swap, note an auction etc

Who sez so --- well to create order out of chaos -- guidelines were presented and adapted -- see URL:
http://faqs.jmas.co.jp/FAQs/radio/personal-intro

Note it sez

"It's important to post messages to the group that's appropriate for them, and not to the groups that aren't. The whole idea of having different newsgroups is so that folks who aren't interested in, say, homebrewing, don't have to wade through messages about homebrewing on the way to read about Field Day. Posting appropriately is just good etiquette."

So does one have to obey the guidelines -- NO since the NG's are free and mostly unmoderated.
But do we want to wade thru hundreds of message which don't fit the NG subject ????

I for one and many others won't read a post when it is in the wrong NG.

Nuff sed

It is. "All about production amateur radio hardware" according to newsgroup archive info. I believe the FAQ does state this, but the FAQ for this newsgroup seems to be "mis-placed" on the official FAQ FTP site at the moment. Bottom line... discussion, not FOR SALE postings. The rec.radio.swap newgroup is for that, and it rediculously redundant to post for sale items on any, or all, of the other amateur radio discussion newsgroups.

I have a Excellent condition 101EX 10-160 meters. Still has the plastic film on the faceplate of the radio. Looks Extra nice. Works good, just like it should. I would call this a 9+ out of a 10. Only one small mark on cabinet i could see. Excellent condition.
Have power cord and Manual for it. Has optional fan unit installed. Would like 325.00 shipped on this Extra Nice Looking Yaesu. Open to trades.

4664. Have tubes, need INFO!

Hello all,

This is my first post, so please be kind.

My Grandpa was an avid Ham and Shortwave Radio enthusiast. After he passed, I found a box full

of old tubes in his garage. I would like to gain some knowledge about the applications of the

various tubes, and ultimately find out if they would have any value to a collecter. Below is a

complete list, along with what cross reference numbers I have been able to locate, so far. Any

help with THAT is also much appreciated!
==========
Vintage Vacuum Tubes:

Count Tube# Cross Reference #'s

I have the following items for sale that are excess to my needs. Prices
do not include shipping. I will ship overseas.

Signal Corps U.S. Army Test Set Frequency Meter Test Set I-129-Bï¿½ï¿½ï¿½.$125
plus shipping.
Military set of James Millen wattmeters covering 1.5 to 40 MHz. Case
manufactured by Hickok .Excellent condition
http://members.cox.net/radiostuff9/wavemeters1.jpg
http://members.cox.net/radiostuff9/wavemeters2.jpg
http://members.cox.net/radiostuff9/wavemeters3.jpg
http://members.cox.net/radiostuff9/wavemeters4.jpg

Gonset Communicator III - 6 Meters...........$75 plus shipping
This is a separate receiver and and crystal controlled transmitter from
the 1950's . Unit works but needs dial cord restrung on receiver.
Includes a bunch of crystals. The radio has a number of scratches.
http://members.cox.net/radiostuff9/gonset_comIII_6m.jpg
http://members.cox.net/radiostuff9/gonset_comIII_6m2.jpg

Eico 315 Signal Generator...........$45 plus shipping
This signal generator that covers 75 kHz to 150 MHz in six bands. Output
is either a modulated or a pure RF signal. The unit is in nice shape and
works. Includes a copy of the manual.
http://members.cox.net/radiostuff9/eico315.jpg

For Sale.....ZM-3A/U Capacitance Analyzer.........$100 plus shipping
Nice unit, works well, new power cord. Insides look like new. Don't have

a manual , however they are available from several sources on the
internet
http://members.cox.net/radiostuff9/zm32.jpg

Book - "The Portable Radio in American Life" ....$25 plus shipping

This is an out of print 260 page book published in 1991 covers the
history of portable tube radios and transistor radios from the 1920's to
the 1970's. Includes historical information on Sony, Zenith radio,
Admiral radio and many other brands who built portable radios. This is
an excellent reference book if you collect portable and transistor
radios. This is a new book which is still sealed in the wrapper. The
photo is of my copy. This is a great radio reference book. I have 8 of
these books left.
http://members.cox.net/radiostuff9/portableradiobook.jpg

Kenwood MC-50 Microphone ....$75 plus shipping
This mike works with the Kenwood TS-830S, TS-530S and a number of other

Kenwood radios. The mike is in excellent condition and comes from a nonsmoking environment.
http://members.cox.net/radiostuff9/kw_mc50.jpg

Kenwood MC-80 Microphone.....$75 plus shipping
This remote tune mike is for use with radios such as the Kenwood TS-440S, TS-430S and possibly some other Kenwood radios. Nice shape and works well.
http://members.cox.net/radiostuff9/kenwoodmc80.jpg

Transceive Cable for Kenwood Twins: R-599 Receiver and T-599 Transmitter.....$50 plus shipping
http://members.cox.net/radiostuff9/kwtwins_cable.jpg

Bird Wattmeter Slugs
All have been tested in my Bird 43 wattmeter.
50D Slug: 200-500 MHz, 50 watts.....$55 plus shipping
http://members.cox.net/radiostuff9/bird50wuhf.jpg
161A Slug: 400-1000MHz, 25 watts.....$55 plus shipping
http://members.cox.net/radiostuff9/bird25wUHF.jpg

Set of crystals for the Navy TDQ transmitter...$110 plus shipping
Their are 24 crystals of which 23 are the original Navy crystals; one crystal is not. The wooden box is in great shape also.
http://members.cox.net/radiostuff9/tdq_xtals.jpg
http://members.cox.net/radiostuff9/tdq_xtals2.jpg

Heathkit V-6 VTVM.....$30 plus shipping
with a photocopy of the manual and test leads. This is a vintage VTVM in nice shape. The unit works but needs to be calibrated. This is explained in the manual and is pretty straightforward.
http://members.cox.net/radiostuff9/heathvtvm.jpg
http://members.cox.net/radiostuff9/heathvtvm2.jpg

Swan Model SWR-1 SWR/Power Meter .....$35 plus shipping
This is a 1 KW unit that covers 3.5 to 150 MHz. Tested and working. This is a neat item if you are a collector of Swan equipment.
http://members.cox.net/radiostuff9/swan_swr1.jpg

Sonar LP Filter - NIB E.F. Johnson Clone.....$40 plus shipping
This looks like a clone of the EF Johnson low pass filter however it has a neat chrome finish. This is new in the box with instructions and mounting brackets. This is a 52 ohm filter that will handle 1 KW from 2-30 MHz.
http://members.cox.net/radiostuff9/sonar_lp_filter.jpg

National Type MCN Vernier Dial - New in Box!.....$45 plus shipping

http://members.cox.net/radiostuff9/mcn.jpg
http://members.cox.net/radiostuff9/mcn2.jpg

Metrotek Mustang Vintage 1960's Tube CB Radio.....$75 plus shipping

Easy conversion to 10 meter AM. This is a 7 Tube Transceiver from the mid 1960's. It has a tunable receiver and 6 crystal controlled channels for transmit and receive. This will work on 110 and 12 volts. The radio works great on transmit and receive. it currently has one channel crystalled up. The power cord included is for 110 volts. It has the original factory microphone. The inside is clean and unmodified with no signs of abuse or burned components.
http://members.cox.net/radiostuff9/Mustangcb.jpg
http://members.cox.net/radiostuff9/Mustangcb3.jpg

Drake ML-2 Marker Luxury 2 Meter Transceiver.....$75 plus shipping

This 1971 2 meter transceiver has a solid state receiver and a tube final putting out 10 watts plus. Also has a built-in AC/DC power supply. This one is in nice condition and works well. This one has the original crystals for 34-94, 94 Simplex. For more info on this radio visit this link: http://www.dproducts.be/Drake_Museum/ML2.htm

The 191 was designed to set scope amplitude.
The output p-p voltage is well controlled over the frequency range.
IRRC it has 5V p-p output and is inadequately shielded for RF work.
You can put an attenuator in the output, but the box leaks so much
it will override your output when testing receivers.
The frequency is not all that stable and changes with amplitude
and load.
But it's a damn fine unit for calibrating scope verticals.

FS: Icom IC-781 Excellent Condition

I was told by Icom USA that this was the last IC-781 sold new in the US. I have had it since I bought it new a few years back and it is in like new condition physically and electrically. I live in the Atlanta area and would be happy to meet a buyer within a few hours drive. I would like to get $3300.00 for the radio and would be more than willing to let anyone in the Atlanta area come by and check it out. I'll keep it listed till the weekend and if it isn't sold will probably list it on ebay.

Thanks,

Richard / N1VXW/4

This has been discussed to death in the past.

You and I and everybody else have NO POWER to control what will be posted here and starting yet another round of complaints will do no good and just overwhelm the posts of things we are interested in or feel are the only things that should be allowed.

Why not cut THIS "crap" complaint and get on with more important things?

THIS DISCUSSION is worse than the FA posts and will likely take up more time and bytes and energy than the FA posts. I guess I'll add this subject to my filter and not have to bother seeing it.

As long as posters uses the requested FA or FA: for auctions and FS or FS: and doesn't try to hide FA or FS items with a deceptive title, you can use a filter and never see them.

If you don't have a way to filter out the FA and FS posts so you never see them then use some other free news reader. Even my several year old Netscape works fine to filter out "crap" posts like this and the fallout that it'll generate.

If you're still using a simple text reader and your system won't run more modern software just realize that's a problem you'll have to deal with.

Ebay sellers are responsible for the ruin of a lot of newsgroups. They
don't care about abiding by any FAQs or Charters, they just want to try
to dig another buck out of their auction.

If you do this on the boatanchors group, which used to have lots of good discussion about boatanchors, you will see very few posts as most now are ebay ads. Thanks to the ebay croed the group is no longer used for it's intended purpose.

For Sale: ICOM IC-735 Main Tuning Optical Encoder (NEW!)

This replacement part was purchased from ICOM about a year
ago but never used. It is now a rare item because they are
no longer available from ICOM. It is in perfect condition.

This is a beautiful part with an adjustable tension control.
It could easily be used in other applications as well.

Pictures:

take your pick! you can use internal batteries, internal AC, or external DC...

i have the internal AC PS, but if i want, i can just unplug it from the
back of the 897 and use external DC... see the 897 manual for details..

and yes, i'd say the rig is a good deal for $700+change...

Oh, things like that are perfectly "OK" in the U.S.A.
Just don't try to go through an airport with
a bottle of breast milk, though.

Yup, and in r.r.swap it will find a better audience! Personally, I don't care as long as the poster puts an FA in the message so I can filter the message, but this really isn't the group.

Though I agree in part that E-bay and private ads shouldn't be in "this" type of news group, I'd much rather see them listed so long as they have FA/FS, etc as a header than ads for sexual drugs, devices, porn, etc. At least the radio gear IS on topic. I've put ads here in the past myself for parts I felt some may be interested in. Some which were for older gear. I too have seen some interesting ads in here which caught my eye. As any and all have the option to do, I CAN SKIP THEM if not interested. Just my 2 cents. G.W.

What happens is others see the FA and FS ads and assume it must be OK to post such, do so, and the group tends to become more of a place for ebay sellers to hawk their wares than a discussion group. That is what happened to the boatanchor group, very little discussion about boatanchors there anymore because the ebay jokers insist on using it to hawk their ebay ads instead of placing those ads in one of the .swap groups where they belong. Now anyone who wishes to discuss boatanchors does not bother with the group because they know it is full of ebayers trying to get another buck for their junk on ebay. So if you go to the boatanchors group and skip the FA/FS ads, there isn't anything left thanks to those who choose exercise their 'rights' and ignore FAQ's and Charters.

Hey, here is another one for the lists....
Sent this monkey $125 on a radio deal that never came through over 9 months ago and still I don't have a penny of it back.
He keeps answering email, etc, telling me it is in the mail, went out yesterday, on the desk to go out tomorrow, etc, etc... but he's a liar of course.
No respect for the fellow man so none from me, hence this post.

Thanks for that look and if you get time, call or email and ask him to send my money back, please.

If you sent payment via U.S. mail, time to get your local postmaster
involved to investigate mail fraud.

I have to agree. I had a bad deal with a guy in Florida, and I
contacted the Seattle fraud office. They sent forms, which I filled
out and sent back, and the guy shipped FAST. He had so many
nice emails to me all of a sudden I thought he found Jesus. Give it a
try - it the guy is a 'real person' he'll probably shit his drawers
when that USPS registered mail comes, and send the goods in
a heartbeat (assuming he has any left).

Just my 2000 microcents.

From: Richard Lubash <2k-plus@2k-plus.com>
Message-ID: <041220031229568323%2k-plus@2k-plus.com>
Source record: 25133

FS: Icom IC-781 Excellent Condition

$3300.00 OBO

Will Deliver 2hrs from Atlanta or ship anywhere.

I was told by Icom USA that this was the last IC-781 sold new in the US. I have had it since I bought it new a few years back and it is in like new condition physically and electrically. I live in the Atlanta area and would be happy to meet a buyer within a few hours drive. I would like to get $3300.00 for the radio and would be more than willing to let anyone in the Atlanta area come by and check it out. I'll keep it listed till the weekend and if it isn't sold will probably list it on ebay.

Thanks,

Richard / N1VXW/4

I think people do this because they are insensitve, crude and
inconsiderate, plus they may be greedy and selfish too.

I think that's why they post E-Bay junk here.

It does make me wonder how effective E-Bay is though, if it needs the
extra "help".

Happy Holidays to all...Howard

Don't forget the many which are posted repeatedly for the same item,
or the hourly updates on when the auction closes.

My idea would be to have a special Website for all of the eBay
auctions, and the people who want to look at auction items could go
there, and others could choose not to. They could call it ebay.com or
something, have a search engine, and all sorts of other features.

Happy trails,
Gary (net.yogi.bear)

Yes, but one way is dB of signal, the other is dB of noise.. (the two in
this case being mutually exclusive).

We get it but he dosen't or he is just another of the ebay types that
couldn't care less as long as he might squeeze another buck for his auction.

What a great idea, why did someone not think of this before? That way, people with six or more working brain cells would be able to go there and just put in what they were interested in and find it then there would be no need to spam DISCUSSION newsgroups with ebay ads.
But even is such a place existed, the ebay clowns don't think others have the capability of using such a sophisticated search engine so it behooves them to make sure we know about their auction through the newsgroups.

Source record: 25049

Hi all,
A friend of mine recently I wanted to start Packet Radio with a
Kenwood TH-F7E and TNC with 9K6.It works fine on receiving but has
trouble with transmitting. It can not get any connect although PTT
works fine and the TNC also works with another radio.
It seems there is something wrong with the outgoing signal of the
TH-F7E.Maybe the gain is too low?
Anybody experienced the same problem with that handheld from Kenwood?
Any help would be greatly appreciated!
Thanks and 73 from Tom, DL2HRF

I just exchanged some emails with the owner of this email address, and he says he didn't post these messages from radioman:

"I did not post that message. Someone must have used my Email address. I have never visited the Newsgroup you mentioned and wouldn't even know how to find it. The radioman Email address is one of my Email addresses,but I seldom ever use it."

So what's worse, posting auction listings on this NG or being a fraud and an identity thief?

Hi Mark, I am the one that posted the message. When I tried to get the radioman email address it said it was used by another so I grabbed radioman2 but didnt get the 2 after radioman correct in my newgroup program. Sorry but it was just a typo and a honest mistake and I'm not trying to be anyone else. Thanks

OK, no problem. We all make mistakes. But you might want to contact the
guy with the 1st address, he certainly is puzzled!

Mark

Anyone that understands the operation of solid state PA sections with band pass filtering for each band would not risk using the rig out of band. It may not of hurt anything yet but why risk it. In time it will catch up to you. The filters are designed to present a safe matched impedeance to the PA for a specific frequency range and attentuate any spurs. Icom says no...what about "dont do it " dont you understand?

Patcomm at http://www.patcommradio.com/ is the only other American
maker I know of, for factory-built transceivers in the 100 watt class.

Elecraft has a 100 watt rig, as well as several QRP rigs, but they are
all offered in kit form.

Ameritron, Alpha, Command and QRO all offer pretty good high power ham
amplifiers.

Otherwise, there are plenty of domestic companies that make things
like antenna tuners and accessories, but the American-made pickings
are generally pretty slim.

There are several American CB makers who offer stuff for "ham use" but
I'd stay away from them.

Bob

SGC, of Belleview, WA, I think, also makes a nice line of transceivers,
including up to 100W units.

MFJ makes some nice little 12W PEP single banders too.

4766. Kenwood TS-480 specs

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-08 01:31:28 UTC
From: ewing@alum.mit.edu
Message-ID: <1a401485.0312071731.6c0a92cc@posting.google.com>
Source record: 25089

The TS-480HX/ -480SAT is out, apparently. At least HRO says they have some stock. Kenwood USA web site (kenwood.net) is very unhelpful in general (IMO) and is specifically unhelpful about the -480 - "No additional information is currently available regarding price or time of availability."

However, the German Kenwood site http://www.kenwood-electronics.de/ts480.htm is much better, esp. if you read German. The big item is that they have the _English_ operating manual available as a pdf: http://www.kenwood.de/download_com/kenwood_anleitung_ts480_eng.pdf .

So I downloaded it (5 MB), and its specs are interesting: includes 60 M, for example. However, the receiver specs are very sketchy. What I want to know is whether this rig has a competitive receiver in terms of BDR, IMDDR, etc.

I am afraid since they give no specs like this, they're not going to be especially good.

They do claim good flexibility for PSK31 filter settings, which is very good for me, along with 60 M.

Anyone with data, please give a pointer.

There are lots of American made HF radios that are sold to commercial,
government and military users. Harris is probably the premiere US made
radio company behind Collins, who still may make HF airborne equipment.
You might also check Cubic, Datron, Sunair, Scientific Radio Systems,
Mackay, Loral TerraCom, and Raytheon.
Harris has been producing full DSP IF HF radios since the early 90s that
seem more advanced than the latest Icom equipment I have seen.

For Sale: Conar Twins - Conar 500 Receiver & Conar 400
Transmitter....$125 plus shipping
These are a beginning transmitter and receiver made by the National
Radio Institute of Washington DC in 1965. The receiver is a 4 tube
superhet with a built in speaker covering the three novice bands at the
time 80, 40 and 15 meters. The transmitter is a single 6DQ6 with and
input power of 25 watts covering the same three bands. I opened up the
receiver and transmitter and they look to be original and unmodified.
The receiver works well. In fact I was impressed with how it sounded for
a simple superhet. The speaker which is on the side of the unit needs a
grill cloth as it is missing. The transmitter has been checked also and
puts out 15 watts on the Bird wattmeter. The transmitter does have one
small hole on the front panel. Included are copies of the transmitter
and receiver instruction manuals.

Powered by Mandrake Linux, no reboots since 5 February, 2003

A Star Tribune letter writer expressed frustration that Tim Pawlenty and the House aren't listening to her desire to pay more taxes. She need not feel so frustrated. She is perfectly free to send any amount of her income to the government or the nonprofit of her choice. The unstated reason for the frustration is that she wants the House to raise everyone else's taxes to pay for the social programs she desires.

Hi Mark - I had a problem like this with a guy two months ago on a bounced check (it bounced 20 days after I had shipped the radio). It was for $90. After 2 months of going round and round, I told him I would file a theft report with his local police department. I am not sure if you can file a theft report from out of state over the phone but I received my money via priority mail a week later. The guy also worked for the police department.

Might be worth a try.

Dave

A while back, I had a problem with a guy out of state in a similar
situation. I called the department in his area. I was told to contact my
local department who would then file a report with their department to get
the ball rolling. So, you may want to check with your police department.

Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

FOR SALE -- a nice QRP station:

Yaesu FT-817 transceiver, s/n 0K020304
with all standard accessories, box, manual
with YF-122C CW filter installed
with Maha FNB-72 battery, 9.6v @ 1700 mAH
NO DAMAGE OR REPAIR HISTORY

LDG Z-11 antenna tuner (factory assembled)
with box and manual
One-Touch-Tune interface factory mod kit installed
external ground binding post neatly added to rear panel
power connector changed to different size of same type
original connector included so can be changed back

W4RT Electronics One-Touch-Tune module

Homebuilt DC power distribution box
2" x 2.5" x 3.5" painted aluminum Bud box
nice long input cable with banana plugs
three separately-fused banana jack outputs

Homemade brackets to bolt FT-817 and Z-11 together
using only stock hardware and mounting holes
no mods to either unit required to use these

Homemade tilt stand
made from upside-down CB radio mounting bracket
not fancy, but does the job quite well

Boom mic / stereo headset
with all necessary cables
mic element is electret condensor type
with homebuilt PTT switchbox
uses stock Yaesu mic cord (detaches from mic head)

SEE COLOR PHOTOGRAPH AT THIS URL:
http://www.qsl.net/k5dh/sm6_gear.jpg

Keyer, paddle, and clock shown in pic are NOT included.
This is nice, clean gear that has not been abused. It
has been transported only in a padded carrying case. I
am a non-smoker. Sorry, no trades (I have a new rig to
pay for!). To be sold as a package deal only. This is
a complete station that needs only a power supply, code
key, and suitable antenna to go on the air! The LDG

antenna tuner does a wonderful job loading a 35 foot
piece of insulated hookup wire as an antenna on all
bands from 80m through 10m (using a wire counterpoise).

PACKAGE PRICE $650.00 FIRM. Buyer pays shipping.

Had a question for open discussion

Is there available, can it be done to have an AM and/ and or FM transmitter that will broadcast over the entire AM and FM broadcast band at the same time. Or at least multiple stations. E.G.

From 88 - 108 at once or 88-98, then 98-108
Same on AM band.

It would have to be a low power to be able to be used on private property and limiy range to 300 mtrs

Can this be done, where can l buy it, or how do l make it

Told you it was a dousy of a question, whats your thoughts.

FOR SALE -- a nice QRP station:

Yaesu FT-817 transceiver, s/n 0K020304
with all standard accessories, box, manual
with YF-122C CW filter installed
with Maha FNB-72 battery, 9.6v @ 1700 mAH
NO DAMAGE OR REPAIR HISTORY

LDG Z-11 antenna tuner (factory assembled)
with box and manual
One-Touch-Tune interface factory mod kit installed
external ground binding post neatly added to rear panel
power connector changed to different size of same type
original connector included so can be changed back

W4RT Electronics One-Touch-Tune module

Homebuilt DC power distribution box
2" x 2.5" x 3.5" painted aluminum Bud box
nice long input cable with banana plugs
three separately-fused banana jack outputs

Homemade brackets to bolt FT-817 and Z-11 together
using only stock hardware and mounting holes
no mods to either unit required to use these

Homemade tilt stand
made from upside-down CB radio mounting bracket
not fancy, but does the job quite well

Boom mic / stereo headset
with all necessary cables
mic element is electret condensor type
with homebuilt PTT switchbox
uses stock Yaesu mic cord (detaches from mic head)

SEE COLOR PHOTOGRAPH AT THIS URL:
http://www.qsl.net/k5dh/sm6_gear.jpg

Keyer, paddle, and clock shown in pic are NOT included.
This is nice, clean gear that has not been abused. It
has been transported only in a padded carrying case. I
am a non-smoker. Sorry, no trades (I have a new rig to
pay for!). To be sold as a package deal only. This is
a complete station that needs only a power supply, code
key, and suitable antenna to go on the air! The LDG

antenna tuner does a wonderful job loading a 35 foot
piece of insulated hookup wire as an antenna on all
bands from 80m through 10m (using a wire counterpoise).

PACKAGE PRICE $650.00 FIRM. Buyer pays shipping.

Contact me at: K5DH@QSL.NET or call 469-766-3551

(sorry for the bogus "from" address, too much spam email!)

I have a good condition 9/10 cosmetically, 10/10 functionally. With whip rubber duckie, Kenwood rapid charger and 1 good battery. I will sell for $100 shipped CONUS. Photo upon request

Also for sale, cleaning up:

I was given a new RS pro-96 for a present. We do not have digital here. I am selling it since I already have a BC780XLT. The package is complete from RS, box, manual, antenna, clip and regulated external PS. I will sell the package for $500 shipped. POSTAL MO only. I do not use paypal.

Also have Motorola trunking base and some P110 UFH portables. Photos available for all.

This needs clarification. Do you mean that it will generate multiple carriers? Like this?

At the same time the output has carriers @ 88.1 and 88.3 and 88.5 and 88.7.....97.5 and 97.7 and 97.9 ???? Actually this is possible if you can make the proper circuitry. An oscillator FM modulated with a 200 KHz signal will do it. You just need enough deviation. You could also add in the audio modulation.

For Sale: Yaesu FC-20 Auto Antenna tuner.

Never Mobil, Excellent Condition. Works with FT-100, FT-897, Etc.

Comes with Phamplet, Interface cable, original packing. Used with my FT-840
as a base station.
$170.00 OBO plus $14.00 shipping.

4793. Ham Radio Deluxe v1.1 released

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-09 19:42:31 UTC
From: igoruberwald@home.nl
Message-ID: <e9b53b2a.0312091142.3346b780@posting.google.com>
Source record: 24967

Hi all,

The award-winning Ham Radio Deluxe Development Team are pleased to announce the release of Ham Radio Deluxe v1.1.

HAM RADIO DELUXE IS FREEWARE.

For those who didn't know it already, Ham Radio Deluxe is the logical evolution of the immensely popular and groundbreaking FT-817 Commander program. Unfortunately the FT-817 Commander was only capable of controlling Yaesu's FT-817, and there was a clear requirement for a CAT program with comprehensive support for various rigs. This led to development of Ham Radio Deluxe being started in early June 2003, since when the program has been rapidly evolving.

Ham Radio Deluxe does not make the mistake of trying to look like a traditional radio with rotary knobs and buttons. The GUI is more reminiscent of an old Eddystone receiver, with clearly marked buttons for switching modes, filters and other functions. Some - but not all - rigs also support sliders, which can be displayed or hidden as preferred, to control volume, IF shift, RF gain &c. The GUI is fully user-configurable with respect to colours, fonts and band indicators: this offers the user an unprecedented level of customisation. Because the program is so simple and logical to use, no documentation is required other than the rig's user manual.

Included in the package are PSK31Deluxe and Mapper.

PSK31 Deluxe is a very sophisticated PSK31 program based on Moe Wheatly's PSKCORE.DLL. It has two main guises: a traditional QSO window type of user interface, and the revolutionary SuperBrowser - SuperBrowser allows you to monitor up to 40 QSO channels at one time while conducting a QSO. PSK31 Deluxe offers comprehensive user-defined macros and tags, and of course the GUI is fully user-configurable.

Some of the more interesting features are:

The unique SuperBrowser.
Centring of the desired signal in the filter's passband.
ï¿½Click and insert' of your QSO partner's information into tags and macros (callsign, name, QTH &c)
TX frequency shift for soundcards with differences between RX and TX frequency.
A fully customisable waterfall display.

MAPPER:

Mapper is - the name says it all - an amateur radio mapping program. It is capable of printing customisable maps of up to 10 x 10 sheets of paper, but its main function is the capture and display of Maidenhead locator information from PSK31 Deluxe. Beam heading and distance can also be displayed, and for the QRP ops among us there is also a 'miles per watt' calculator. Just place your mouse pointer on the relevant spot on the map and read off the MPW.

RIG SUPPORT:

At the time of writing (4 December) the following rigs were supported:

Elecraft K2, ICOM IC-703, IC-706, IC-706MkII, IC-706MkIIG, IC-718, IC-735, IC-7400, IC-746, IC-746Pro, IC-756, IC-756Pro, IC-756ProII, IC-775DSP, IC-781, IC-910H, Ten-Tec Argonaut, Yaesu FT-100, FT-1000D, FT-1000MP, FT-817, FT-847, FT-857, FT-897, Kenwood TS-140S, TS-2000, TS-450S, TS-50S, TS60S, TS-570, TS-680S, TS-690S, TS-850, TS-870, TS-940S, TS-950.

These programs are in a constant state of development, with new features and rig support added almost weekly.

You are invited to join the Ham Radio Deluxe users group at:

http://groups.yahoo.com/group/ham-radio-deluxe/

where you will find a great many enthusiastic users who can help you with (almost) any questions you may have.

Just to boast a little, Simon and I were awarded the RSGB's Special 90th Anniversary Award 'in recognition of (our) significant contribution to the development of amateur radio technology' for this package.

You can download the latest version of all these programs at:

www.hb9drv.ch

I tried to get two Windows XP computers to tr switch via the com port.
when running PSK31 deluxe
Neither works.
Windows 98 was fine.
Anyone have any tips?

4799. New Program: Rho-Swr

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-10 00:58:29 UTC
From: Reg Edwards <g4fgq.regp@ZZZbtinternet.com>
Message-ID: <br5r3lfqn1@hercules.btinternet.com>
Source record: 24971

Program models TRUE measurements of SWR and Rho by moving current and
voltage probes along a transmission line.

Exact classical transmission line formulae used on a real lossy line with a
complex value of Zo = Ro - jXo.

Covers frequencies 20 Hz to 1GHz.

Download from website below program RHO_SWR, 50 kilobytes in a few seconds.

Read introductory notes.

Perhaps he is into re-inventing the wheel, so to speak ??

As I understand it...a rotary spark was modulated at some time in the early
part of the 20th century, and created such an effect.

Does anybody know if the CFL-230 300HZ cw filter will work in a JRC JST-245 Transciever? The CFL-230 is normally used in the NRD-515 receiver. The 245 normally uses the CFL-231. I think their center frequency 455khz.

Thanks, Joe, WB8HWF

4808. Help... SB-200 behaving badly

Newsgroup: rec.radio.amateur.equipment

From: i_hate_spam@so_dont_send_me_any.com
Message-ID: <wCMBb.387$b77.437@dfw-service2.ext.raytheon.com>
Source record: 24980

Okay, all you linear amplifier experts...
put yer thinking caps on...

I have a Heath SB-200 amp that's behaving badly. It works just fine on 80m through 15m, putting out over 750 Watts PEP on 80m and 600 Watts PEP on 15m. On 10m, it's not working right at all. Instead of the plate current dipping at maximum output, it's peaking at maximum output, and it's very low when off resonance. This is just the opposite of what I'd expect, and of what happens on the other four bands. Maximum output on 10m is only about 150 Watts PEP, with 100 Watts of drive. There are no signs of arcing going on. This amp lived a questionable life before I got it, which made me think that perhaps the PA tank coil had been hacked for 11m use. Nope, it's fine. The band switch contacts are in fine shape as well. I've rebuilt the entire RF deck, so all of the wiring is correct and the soldering is professional-grade. The circuitry is all stock and completely matches the original schematic. Since each band has its own input tank circuit, is it possible that I have a bad component in the 10m input tank circuit that's hosing things up?

Thanks in advance for any help you can provide!

73,
Dean K5DH

4809. IC-781 PRICE REDUCED

FS: Icom IC-781 Excellent Condition
PRICE REDUCED TO $2750.00

I was told by Icom USA that this was the
last IC-781 sold new in the US. I have
had it since I bought it new a few years
back and it is in like new condition
physically and electrically. I live in the
Atlanta area and would be happy to
meet a buyer within a few hours drive or
ship the radio by your preferred carrier.
Thanks,

Richard / N1VXW/4

While probably not the problem, some later modle Heathkit amps were made so they would not operate on 10 meters. You have to change some wiring around the input tuned circuits or filtering. Not sure exectlly what, but a friend of mine had to do this and he was telling me about it. All that junk about not making amps that would work in and around the CB frequencies.

4813. lpfm transmitter 10 mW

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-11 01:16:21 UTC

I seem to recall it was around '78 or '79 when they stopped selling
amps that were 10 meters capable, right out of the box.

4835. ic746pro: reliable enough to buy?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-11 22:26:33 UTC
From: Martin Ewing <aa6e@arrl.net>
Message-ID: <ta6Cb.35861$p_5.299@newssvr32.news.prodigy.com>
Source record: 25015

Hello,

I am doing market research for a new HF rig, and the Icom IC-746pro would be a leading choice, but I'm worried about the "no transmit" and other problems discussed at length on the web.

Of course, you take your chances whenever you get a new high-tech toy. My question is how does the '746pro stack up against the competition in terms of actual failure rate and reliability? This is something the manufacturers are keenly aware of from their warranty data, but they probably aren't going to share it with us. :-(

Most of us don't see enough different examples of enough types of rigs to have first-hand data, and anecdotes on the net are hard to calibrate. Given the bad press on the '746pro, I am pretty leery now, but if it's really only a small percentage of units that are affected, I might reconsider.

How would you decide?

Just a follow up on this, if anyone was interested (and for the archives in case anyone else is looking for this!). I found a radio that is a 2m mobile and has receive capabilities in UHF and even up into 800mhz. The Yaesu FT-3000. I found a used one that I will be buying!

Ramsey Electronics FM-25B. Available as a kit or pre-built. It uses DIP switches inside to set the frequency but does cover the entire FM band, is crystal controlled, stable, stereo, and up to about 25 mW. You can adjust the output power. It comes with a built-in whip antenna as well as an external antenna jack if you need more coverage. I just built one for a local client - took me about 6 hours and worked just fine. The kit comes with the power supply, enclosure, antenna, etc, and costs about $120. I think the pre-built unit is closer to $170.

I picked one up about 6 weeks ago, liked the price with the
recent promo. So far I rather like it :-) As far as I could determine,
the various problems you refer to occur only on earlier serial
number 746s. Check with me in a couple years about the
failure rate ...

Do I like it as well as my Kenwood TS-850?
Not sure yet. Certainly don't like the 746 less than the 850,
but I'm not yet certain I like it better.

Mostly CW DXing and SSB ragchewing.

Excellent question. WHY ARE "YOU" SHOUTING, N2ION?

What N2IOW doesn't understand is:

1. most hams need to sell one rig to buy another
2. most hams have deep pockets and want paid for the rigs when getting rid of them
3. most ham have a reputation of being cheep
4. why would any ham give their equipment to some guy in NY when, if they where going to donate it they would give it to a local school radio club.

4846. FS/FT: MOTOROLA MSR2000 VHF REPEATER

Newsgroup: rec.radio.amateur.equipment

From: "R. Belcher" <randy.belcher@verizon.net>
Message-ID: <e2lCb.32$cO5.23@nwrddc03.gnilink.net>
Source record: 25019
Cross-posted to: rec.radio.amateur.equipment,rec.radio.swap

Well, time to move out is coming up in short order and I still have an excellent condition 110watt MSR2000 VHF Repeater (specs below) that I will trade or sell. I'm looking for a small programmable repeater like an R100 UHF 50w or better that the locals can use in the ham band. Will consider other items or repeaters. A pair of excellent condition VHF 16ch, HT1000's w/chrgrs would be great too, just to give you an idea.

SHIPPING IS ONLY $50 (intermittent schedule, may take a couple weeks) if you live in these areas or along the route from Charleston, WV:

Detroit, MI
Pittsburgh/Donora, PA
Cumberland, MD
Paducah/Madisonville, KY
Tazewell or Galax, VA

Shipping to other areas can be arranged thru commercial carriers, but will be more expensive.

SO.... If you have something to trade let me know, and if all else fails, just make an offer.
(Worst I can say is no, but it's awfully close to Christmas and I'm in a good mood.)
Moving, must sell, etc, etc....

==========
THE SPECS:

Motorola MSR2000 VHF Continuous Duty Repeater, short cabinet will fit duplexers (dupes NOT included).
MODEL: C73KSB-3106BT
110w Output, VHF 150-162MHz, includes cards: Station Control, Time Out Timer, Squelch Gate, PL (2 vibrasponders on 107.2), R1 Audio.
All covers, doors, etc included.
Will need channel elements for your freq. One set of elements included, 163 and 151MHz.
Unit is very clean, above average inside.

Pix available here (Please don't confuse a folder with an auction site):

4847. No ACL/RL CONT for the amp ?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-12 15:49:19 UTC
From: Thierry <"To answer me in private use http">
Message-ID: <3fd9e37d$1_2@news.vo.lu>
Source record: 25020

Hi,

For demonstrate the functioning of an HF amplifier I have to use a Kenwood TL-922 amp with a Kenwood RTX TS-570D.
I should connect the RTX "ACL EXT" and "RL CONT" cinch output to the equivalent on the amplifier rear side but this RTX does not has such terminals.
Here is the layout of the rear side :
http://www.astrosurf.com/lombry/Radio/ts570-rear.gif
and front side to be complete :
http://www.astrosurf.com/lombry/Radio/ts-570d.jpg

I know for having used similar configuration (another RTX) in the past that I can work without this link between the RTX and the amp at the condition toi be able to modify the PA driver.
Unfortunately this amp request 80-120 W in. I can offer it 80-100W and I use a external SWR-meter to check the ouptut power and VSWR
NB. The PA will not be overdrived and thus the ACL voltage will be 0. So at first sight there is no problem to work this way.

Question : using this TS-570D is there a risk to damage or to be unable to manage some feature (probably none of the TS-570D) if I do not use the ACL EXT and RL CONT on the amp ?
Or in others words what could happen if I do not use this link ?
and at last is it mandatory to use a RTX offering an ACL EXT + RL CONT cinch with that amplifier ?

Thanks in advance

Thierry

>Excellent question. WHY ARE "YOU" SHOUTING, N2ION?

Respect for tradition, I imagine.

He's asking for boat anchors and old stuff like that. You know,
VIKING and JOHNSON and SWAN and other wonderful old tech. These were
all built with upper-case glyphs (take a look at the original
schematics) because that's all they had available at the time.

Lower case letters were developed later (around the same time as the
first point-contact transistor, I think). They only became affordable
enough to use in schematics, manuals, and product brochures sometime
in the mid-1960s, after a rich deposit of lowercasium ore was
discovered in a province of southern godforsaken. The United States
secretly engineered a coup and installed a U.S.-friendly dictator who
ensured us access to this precious natural resource, and the rest is
history.

Hi,

The kenwood TS-570D, according the documentation is equipped with a notch.
Theoretically this is a very useful feature to cancel QRM in the center of a
frequency and be able to listen to weak stations.

But at first sight there no such a NOTCH control on the TS-570D...
Can some one explain me who is right (me or the manufacturer) ?

My explanation is next : is it possible that the notch, even if it is not
provided as an external button on the front panel is in fact well included
(like "built-in") in the AF-stage circuit of this RTX ?
That could explain the fact that it is not very useful in reducing a signal
in the middle of the frequency vs. a model working at the IF-stage.

Your comments are welcome
Thanks in advance

73

Want to buy a DTMF microphone for my 706MK2G. The new ones cost over $60. Looking for a good used HM-118TN or a good used HM-77A. Would also be interested in a good used HM-14 that I could use with the modular to 8 pin adapter. Price to include shipping to 23323.

From what I can see in the manual, the TS-570D (like the TS-2000) has
an adaptive notch filter implemented in the audio DSP. It's not a
single notch - it can actually detect and notch out multiple tones.
Hit the BC (Beat Cancel) control to enable it. It's on page 38 in the
manual.

I don't see anything in the manual which would indicate the presence
of a user-adjustable notch filter (IF or audio). You can adjust the
upper and lower frequencies of the signal passband, but there isn't a
manually-adjustable notch within the passband.

I need the Power Cable For a Kenwood KGC-6042, or 4042 they both use the same power cable.

I looked at www.pacparts.com but they are ridiculously expensive.

Thanks.

I too liked the looks of it. I joined the Yahoo group for the 746 PRO, and I would advise you to do the same.

According to a late post on the site, serial numbers are being produced with several modifications that should make it more reliable.

Myself, I am leaning toward a new TS 570, even though the features of the 746 are quite alluring.

I could draw parallels between this and beautiful women or fast cars, (cool to have, but often loads of trouble) but I'll leave it to you to make the decision. I guess in our heart we know what's right for us.

The 746pro was introduced in Spring of 2002. (It was reviewed in May
2002 qst.) They oughtta have the bugs out by now.

Buying a new rig is a delicate balance between waiting awhile after
it's introduced, but not so long it's about to be discontinued :-)

Kinda like these damned computers...

How safe is it to run these without forced air cooling?

I've got one as a 1 - 4w driver (feeding a BLW60C) and although has a finned TO5 heatsink, it gets up to 70+ degrees Celsius when running. The Mitsubishi spec says it is safe up to 175 degrees Celsius but am not sure if what I'm doing will do the device damage?

Any thoughts anyone?

Neil

4860. Re: 2SC1947

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-13 14:23:36 UTC
From: TOM <noname@noprovider.nodomain>

Source record: 25033
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

Neil:

Attached is a link to the Mitsubishi datasheet for the 2SC1947.
Regarding the thermal
specifications, the maximum junction temperature is 175C. The thermal
impedance is
15C-per-watt junction-to-case, and 150C-per-watt junction-to-ambient.

What this means is that the junction temperature will be hotter than the
case temperature
by 15C times the numer of watts dissipated. For example, if the transistor
is dissipating 4 watts,
the junction will be 60C hotter than the case temperature. Thus the maximum
case temperature
should be limited to 175-60 = 115C (pretty darn hot).

There will be some thermal impedance between the heatsink and the case,
but if well designed,
and well attached, it should be only 1 or 2 C/watt, almost negligible in
this example.

The 150C/watt junction-to-ambient spec means that the metal case of the
transistor is not
too effective at rediating heat by itself. Without any heatsink, and
assuming 1 watt dissipation, the
ambient temp would have to be limited to 175-150 = 25C (room temperature).

hi
my old bsr xl-1200 cartridge is wired onto the pins so it wont pop out with the 4 prongs as normal one's do. i think i could remove the wires and put each one onto the prongs of a new cartridge but it seems that the bsr cartridge is proprietary. there is one screw on top of the tone arm that holds my cartridge. i'm not sure it will screw into a new one such as the at3482u. anyone here ahve a solution? i could get another direct replacement for the bsr cartridge perhaps but i thought the 3482u (or another) would give me better sound than what i have now. i could perhaps just snap the new cartridge in without screws. all the wires in the tonearm are very thin so its hard to solder in there.
please email me a copy of your response.
thanks

Au Contraire

I found several hard to find items here referring over to E-Bay
1. A Kenwood Grid Dip Meter --- a beauty
2. A Swan VHF SWR/Power Meter WM-6200 MINT
3. A TS-811A 70CM All Mode Nice

I looked for the Kenwood Grid Dip Meter for years

Look here for the next year or so and see if anyone posts these for sale --
very unlikely

Hooray for E-Bay -- wide coverage and THE place for rare items

Have even seen Knight Ocean Hoppers on E-Bay --- rare pricey nostalgic
goodie

I'm a bit confused here. You're writing - appearing to be bitching about annoying E-Bay ads on here, yet you post items for sale and do NOT post FS. You tagged it to your "bitch" post. I do NOT care that you listed the items for sale - but to a degree, you're contradicting your own complaint. Maybe others don't want FS here either - however they are posted. G.W.

4877. 4 Sale...

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-13 20:59:50 UTC
From: Robert Kubichek <bobn9lvu@lakefield.net>
Message-ID: <brfujj$2u73e$1@ID-179885.news.uni-berlin.de>
Source record: 24900
Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment

For Sale;

Dentron Clipperton V 2M-6M amp,
In good working Condition,
2 NIB Eimac 7203/4CX250B tubes
1 4CX250B pull (No brand name)
1 NIB Amperite 6N06OT time delay
1 NEW Eimac SK620 socket and chimney
1 Good Eimac SK600 socket
1 New Eimac SK600 socket
Sold as a group, $650

Kenwood TM-V7A Complete with programming cable,
Software, and remote mount.
$300

Standard C468A 95% $125
Includes 1 CWC150A Wallwart

PacComm Sprint-2 TNC Like new,
With AD-4 Analog-to-Digital board
With cable for Kenwood TM451A $100 obo

Icom 02AT with BC-35,
And extra Ice brick battery $ 80

Dynamic Communications
Model A470-25 $ 25
Sold as is, no manual.

Model 10-0 $ 25
Sold as is, no manual.

Carver Audio Amp 95+%
Model M-2120
With Manual. $ 75

All Items Will include manuals, and any docs that I Have.

I also have a lot of C64's 3 good 3-5 fixable or parts.
Much peripherals - drives,printer,parallel/serial ports,
modems, tape drive, graphics pads, joysticks, ect.
AND a lot of cartidges, and software - games to productivity.
Included is all manuals, plus extra books for programming ect.
Included is software to run a bbs from the C64..
I would like to sell it all as one group. Will cost more,

if sold piecmeal....

Shipping is NOT included

Stuff for sale, auction, swap etc belongs on rec.radio.swap

So sez the NG Guidelines -- URL:
http://faqs.jmas.co.jp/FAQs/radio/personal-intro

You do believe in Guidelines huh ??

Any way about E-Bay stuff

Au Contraire

I found several hard to find items here referring over to E-Bay
1. A Kenwood Grid Dip Meter --- a beauty
2. A Swan VHF SWR/Power Meter WM-6200 MINT
3. A TS-811A 70CM All Mode Nice

I looked for the Kenwood Grid Dip Meter for years

Look here for the next year or so and see if anyone posts these for sale --
very unlikely

Hooray for E-Bay -- wide coverage and THE place for rare items

Have even seen Knight Ocean Hoppers on E-Bay --- rare pricey nostalgic
goodie

Actually, there is a historical acceptance of advertising in the signature.
Provided, of course, that the poster is actually participating in the
newsgroup rather than posting so they can get their signature into
view.

There isn't much of a difference between someone listing a website,
for instance, in a signature and someone mentioning in their
signature that they want something or have it to sell. They all may be
"advertising" but it actually requires that someone be posting something
interesting for people to get to that point. And unlike posts that
are merely ads, they don't fill the newsgroup with junk posts.

Now, once again, the issue has been masked by the anti-Ebay sentiment.
This is not an Ebay issue. It's a matter of advertising in a discussion
newsgroup. The ads don't belong, and what's worse some people aren't
even content to post ads, they do it often, and using multiple posts.
It sure seems like the guy who is most abusive is actually running a business,
which makes it all the worse.

And when that guy starts advertising stuff that has nothing to do
with amateur radio, the saw for instance, that just reinforces what
happens when ads are let in in the first place. People who want to
sell things are not doing us a favor, they want us to do a favor, ie
buy their junk. They don't care about existing discussions, they
want to take advantage of those discussions to sell their junk.
And since you don't care in the first place, then why not post
ads for stuff that has no relevance?

Mine did the same thing. I pulled the knob off and put some penetrating oil
on the shaft. Kroil was the name brand as it does not setup and get gummy
after a week or so like some will. let it sit a day or so and put some
pliers on the shaft and turned it. It finally loosened back up.
Works fine after a couple of years now.

He said he had a SB-200, which by definition is 80-10. A SB-221 did not
operate on ten.

It is possible you are not tuning it correctly. On ten meters, things can
become quite 'squirly'. Put it into a good dummy load and experiment a bit.
Try reducing the load. Bring it up slow. Go between load and plate, see
how that goes.

As one person alluded to, he often finds listings of items on e-bay here that he has been looking for - for a while. I don't mind FA/FS, FT, or what ever (properly tagged) - as I to look at them to see if any interest to me. What kills me is when a person will list 20 different items with 20 different posts. OR list the same stuff a few times a day - almost every day. Now THAT, is a pain in my ass.

On other thorn in my ass, is you see a thread with say for example a Kenwood TS 440 for sale. You click on it and rather than find an ad, you see a bunch of bull shit that has been strung on to it, which as long since become a name calling contest. It has ZIP to do with the subject title. G.W.

Try a 10 ohm 10 watt swamping resistor in the cathode circuit. Sounds like
first order oscillations. See the info at the following URL:

http://www.somis.org/Oct88qst.html

4890. IC-T90A external power question

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-14 02:58:15 UTC
From: behr@muir.math.niu.edu
Message-ID: <brgjk7$i6c$1@news.math.niu.edu>
Source record: 24913

I'd like to make an external high capacity pack for my T90A
for emergencies, long special events etc. The manual isn't
very clear on this subject. I'd appreciate any comments from
those who experimented with it.

I notice that when the wall-wart charger is plugged in, the
HT won't transmit (or if it does, it has minimal power) even
when the battery pack is attached and well charged. It isn't
surprising that the normal little charger is not able to put
out enough current, so the unit must be somehow disconnecting
the battery pack when the power plug is in, and tries to draw
all the juice from the external source.

So I'm thinking of making a waist-belt pack out of 8 NiMH or
6 alkaline C or D cells (so it won't exceed the 11.5V max), a
3A fuse, plugged into the jack where the charger goes. Has
anyone done that? I'm 90% sure this will be OK, since the
charger jack is supposed to work with the ICOM cig lighter
adapter so nothing inside should go up in smoke even at full
transmit power with this arrangement. But some first-hand
experiences would reassure me quite a bit. Thanks a lot.

4891. Question about antenna plug on handheld

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-14 03:49:43 UTC
From: vhfradiobuff@aol.comspamme
Message-ID: <20031213224943.19282.00000776@mb-m13.aol.com>
Source record: 24914

Hello all. I recently uncovered an old TRC-208 CB handheld. There's a spot on the side for an external antenna, but the plug looks like a modern day A/V plug you'd find on a TV or VCR. Anyone know what this type plug is called? It's definately not an RCA plug and not anything modern, like a BNC, Mini-UHF or SO-239. I can get a picture of it if needed.

A pic would be very helpful.. can you e-mail me one? My first guess would
have been an RCA phono plug..

> experiences would reassure me quite a bit. Thanks a lot.

On mine, when the batteries are fully charged the T90 indicates Hi-V
and does not transmit. I assume that it is in self protect mode at that
time.

The manual says not to transmit with the charger plugged in (IIRC).

If I were building a battery pack, I think I would keep it at or under
11 volts for recharging or 8.2 volts for operating. (8.2 is what I see
on turn on whrn the battery has been fully charged.)

Hmm, I've never ever seen that. Mine just says CHG_F and happily
transmits (unless the wall-wart is plugged in).

>The manual says not to transmit with the charger plugged in (IIRC).

With the small wall-wart charger, yes. But it is less clear in
case of the "drop-in" rapid charger, and under the cigarette
lighter adapter CP-19 heading it explicitely says "the BP-217
can be charged while you are operating", so I'm assuming there
is no general prohibition on transmitting while external power
is plugged in. That's what made me consider a self-made pack.

>If I were building a battery pack, I think I would keep it at or under
>11 volts for recharging or 8.2 volts for operating. (8.2 is what I see
>on turn on whrn the battery has been fully charged.)

I suppose it's better to play it safe, but 9.6V is well within
the stated maximum. Still, a lower voltage might work just as
well (given enough current), because the manual also says that
"power supply range is 5.5 - 11.5 V", and then that "maximum
output power is 5W regardless of P/S voltage". So they must be
using some intermediate power conditioning circuit. If that is
the case, maybe I'll start with a 6V pack to be on the safe side
and see what happens.

Thanks for the comments de KC9DUX.

I believe the plug is called a "Motorola" plug if memory serves me correct. It is similar to an RCA with the exception of the center pin being a bit longer and the shell being solid instead of little blades as some are. RS used to sell them. Not sure if they do anymore or not. They aren't too hard to find. They can be found with either a direct wire capability OR as an adaptor with opposite ends such as a SO 239. The plugs sell for about $2 each depending on where you get them. Maybe cheaper. G.W.

Thank you for reading my request ...
I have a Yaesu FT-757GXII All was going fine until my Main Tuning Dial knob started getting very hard to turn. CW and CCW... It just totally seized up on me. Never had this happen before. This has nothing to do with the Tension Adjusting Screw or the Electronic Frequency Lock Switch. Has anyone ever encountered this ???
Please advise... and remedy..... would be greatly appreciated.....
Thank you... John

I'd check it again. The two old R/S handheld CBs I own both have RCA phono jacks for the external antenna. Have you tried radioshack.com and typed in the model number in the Product Manual section. If there is a manual online for it, than you can see what was recommended.

Motorola Radius GP300 UHF 438-470mhz, 16 channel, 4 watt portable with rapid drop in charger.
The battery is about 60%, due to lack of use.
This was a 8 channel converted to 16 channels. I've had the radio over 10yrs and have never had a problem. Also comes with heavy duty belt clip.
Asking $175.00 plus shipping. Cont. US Only.
I'm also looking for a late model dual band mobile for possible trade for the radio.
I would be interested in the following models:
Alinco
DR570
DR590
DR599
DR600
DR605TQ

Please email direct if interested.....

thnx

4907. HELP: how to eliminate the greeting nag on Yaesu FT-90 ??

I have a new FT-90 compact mobile. I realize some production runs had some bugs, but this one is without any problems at all, it works very well.

That aside, EVERY time you power the darn thing up, it scrolls an 'advertising nag' and I have to press a button to get the darn thing to display the current frequency.

The question: Has anyone figured out how to stop it from happening on every power up??

Thanks in advance,
Pat,
VE3PMK

Dennis I use one on my Yaesu FT-817. The OBP I have is the
"max punch" option, that is with the Heil HC4 & HC5 elements.

Reports on my new tx audio were all around great and the OBP
doubled my SSB talk power.

To test, I hooked up a dummy load and watched my QRP
power meter. Then, I transmitted a long "ahhhhhhh" while
switching back and forth between on and off. I had my mic
gain set to 100 on the '817.

With the OBP off I got about 2.5-3 watts on average. With the
OBP on, I got a solid 5 watts on average. 'nuff said!

I'd buy it again if I had to.....

>>

Don-

Which model do they have? AES has the TS-480 HX, but not the SAT model.

I'm looking for a replacement for an older IC-706 used mobile. I like the idea of a built-in tuner in such a small package.

Having to run two power supply cables for half an S-Unit improvement, doesn't interest me.

I believe he was referring to the carrying handle, not the "tilt bail" as
you have described. And I agree, I've owned two FT900's and they are
fantastic radios.

Yes, it's in the manual. Simply power up the radio while holding down
the middle button.

Picked up this Used FC-1000 Automatic Long Wire Tuner and need some coaching.

The Yaesu FC-1000 Automatic Long Wire Tuner was designed to be used with the FT-747GX/ FT-757GX Series Transceivers in that the Freq being used is fed to the Tuner via a cable.

Has anyone had any experience useing this tuner "Stand Alone" without the "matching" Transceiver feeding Freq Data to it? OR has any more Technical Info on its operation? I would like to try to use the tuner with other Transceivers

I am sure there were a number of these units sold into Amateur Service and/or Marine use.
I am presently using an FT-100D with ATAS-120 Screwdriver in my Explorer.

I have the manaul with schematics, and will probably find the answers to my questions EVENTUALLY...just looking to speed up the process ! !

Thank You for any replies
73...Norm VE3CZI

We have a 2 meter REP-100 repeater and the books have left!
Any chance there is someone out there who could make a photocopy
for me? It has a receiver, 2 watt transmitter with a LPA 2-15 amp,
a PL and a COR-4.
I have a copy of the COR-4 documentation - that is the only documentation
that Hamtronics seems to have or be able to supply.
Also have a 30 watt amp for the repeater that we have never used - I'd
be willing to trade it for a copy of the books .... or pay for photocopies,
postage and a couple of bucks extra for the service!

Or where can I get a copy of the books?

Source record: 24809

I have a very nice Heathkit HW-99 CW Transmitter for sale. It looks almost new with only a few very small nicks on the cabinet paint. The front panel is perfect accept for a small mini toggle switch installed below the Band Switch. You have to turn this switch in the up position to access the 10 meter Band. This appears to be the only modification and the construction of the circuit boards is excellent. I checked it out on all 4 Bands, 80, 40, 15, and 10 Meters. It puts out well above 50 watts on each band. The CW tone is excellent and the receiver is very stable and sensitive. It has a built in 120 Power Supply and speaker. It sounds better on an external speaker. The internal is a little tinny.This is a great little CW rig. All you need is a key and an antenna to be on the air. The rig sold for $300 in mid 80's and they only made it for a couple of years, so it is rather rare. See Product Review in March 1986 QST. Price is $225. Thanks, Charlie Hugg, K5MBX

Need Help with my Kenwood TM-741A Triband FM Mobile Radio.....I purchased the radio new some 12 years ago, with the 220MHz. Module Installed....The Radio Has 144 Mhz / 220Mhz / 440 Mhz.....For years the radio worked excellent....Then about 5 years ago I had lost the out put on 144 (two meters)... However , the other two bands functioned fine...220/440mhz... I sent the radio back to kenwood...and they indicated that the Driver Transistor Q23 2SD1902R on the two meter module was defective. This transistor is an inexpensive part...$ 3.05 ea. Anyway...It seems like the same problem occured the other day...all the symptoms seem the same...Can anyone shed some light on why this seems to happen often?? Also is it possible to replace this 2SD1902R transister with something capable of handling some what more power dissapation?? What ever happened to those motorola hep sustatutes?? Any and all info supplied here will be greatly appreciated....

Thanks
Carl

I have the following items for sale that are excess to my needs. Prices
do not include shipping. I will ship overseas.

Signal Corps U.S. Army Test Set Frequency Meter Test Set I-129-Bï¿½ï¿½ï¿½.$125
plus shipping.
Military set of James Millen wattmeters covering 1.5 to 40 MHz. Case
manufactured by Hickok .Excellent condition
http://members.cox.net/radiostuff9/wavemeters1.jpg
http://members.cox.net/radiostuff9/wavemeters2.jpg
http://members.cox.net/radiostuff9/wavemeters3.jpg
http://members.cox.net/radiostuff9/wavemeters4.jpg

Gonset Communicator III - 6 Meters.....$75 plus shipping
This is a separate receiver and and crystal controlled transmitter from
the 1950's . Unit works but needs dial cord restrung on receiver.
Includes a bunch of crystals. The radio has a number of scratches.
http://members.cox.net/radiostuff9/gonset_comIII_6m.jpg
http://members.cox.net/radiostuff9/gonset_comIII_6m2.jpg

Lafayette HB-76 VHF Receiver.....$35 plus shipping
This is a VHF receiver from the 1960's that covers 152-174 MHz. The
unit is in excellent condition cosmetically and does work.
http://members.cox.net/radiostuff9/laffvhf.jpg
http://members.cox.net/radiostuff9/laffvhf2.jpg

ZM-3A/U Capacitance Analyzer.....$80 plus shipping
Nice unit, works well, new power cord. Insides look like new. Don't have

a manual , however they are available from several sources on the
internet
http://members.cox.net/radiostuff9/zm32.jpg

Book - "The Portable Radio in American Life" .....$25 plus shipping

This is a 260 page book published in 1991 covers the
history of portable tube radios and transistor radios from the 1920's to

the 1970's. Includes historical information on Sony, Zenith radio,
Admiral radio and many other brands who built portable radios. This is
an excellent reference book if you collect portable and transistor
radios. These are new books. This is a great radio reference book. I
have 6 of
these books left.
http://members.cox.net/radiostuff9/portableradiobook.jpg

Set of crystals for the Navy TDQ transmitter...$100 plus shipping
Their are 24 crystals of which 23 are the original Navy crystals; one
crystal is not. The wooden box is in great shape also.
http://members.cox.net/radiostuff9/tdq_xtals.jpg
http://members.cox.net/radiostuff9/tdq_xtals2.jpg

Heathkit V-6 VTVM.....$30 plus shipping
with a photocopy of the manual and test leads. This is a vintage VTVM in

nice shape. The unit works but needs to be calibrated. This is explained

in the manual and is pretty straightforward.
http://members.cox.net/radiostuff9/heathvtvm.jpg
http://members.cox.net/radiostuff9/heathvtvm2.jpg

Heathkit AC-3 AC Voltmeter ....$20 plus shipping
This unit will measure ac voltages from 0.01 to 300 volts RMS in 10
ranges and decibels from -52 to +52 db in 10 switch selected ranges. I
don't have the manual but will include the manual from the Heathkit AV-1
which is the older model but appears to be identical except for the
older style housing. This is a working unit.The meter face has cracked
and been glued back together
http://members.cox.net/radiostuff9/heath_ac3.jpg.

Sonar LP Filter - NIB E.F. Johnson Clone.....$40 plus shipping
This looks like a clone of the EF Johnson low pass filter however it has

a neat chrome finish. This is new in the box with instructions and
mounting brackets. This is a 52 ohm filter that will handle 1 KW from
2-30 MHz.
http://members.cox.net/radiostuff9/sonar_lp_filter.jpg

National Type MCN Vernier Dial - New in Box!.....$40 plus shipping

http://members.cox.net/radiostuff9/mcn.jpg
http://members.cox.net/radiostuff9/mcn2.jpg

Metrotek Mustang Vintage 1960's Tube CB Radio.....$75 plus
shipping
Easy conversion to 10 meter AM. This is a 7 Tube Transceiver from the
mid 1960's. It has a tunable receiver and 6 crystal controlled channels
for transmit and receive. This will work on 110 and 12 volts. The radio
works great on transmit and receive. it currently has one channel
crystalled up. The power cord included is for 110 volts. It has the
original factory microphone. The inside is clean and unmodified with no
signs of abuse or burned components.
http://members.cox.net/radiostuff9/Mustangcb.jpg
http://members.cox.net/radiostuff9/Mustangcb3.jpg

Drake ML-2 Marker Luxury 2 Meter Transceiver.....$75 plus shipping

This 1971 2 meter transceiver has a solid state receiver and a tube
final putting out 10 watts plus. Also has a built-in AC/DC power supply.

This one is in nice condition and works well. This one has the original crystals for 34-94, 94 Simplex. For more info on this radio visit this link: http://www.dproducts.be/Drake_Museum/ML2.htm

A paste of baking soda may help, as it will neutralize the acid and is
mildly abrasive. Rinse or swab well.

An eraser will help in buffing the contacts.

Aren't most portable batteries made from metal salts (alkaline,
nickel/cadmium, nickel/metal hydride), and therefor bases, instead of acids?
(please correct if I'm wrong)

In which case, vinegar or a mild boric acid solution would neutralize the
alkali.

I thought of that as I pressed the send key. In any case, the baking
soda is only mildly alkaline. White vinegar would be somewhat stronger
an acid.

I'm building a kit that Ramsey doesn't sell any longer. I recently read the QST equipment review on this radio and found that Ramsey used to provide a mod kit to eliminate spurious emissions. Ramsey no longer has that kit and doesn't seem to have any information about the components or circuit modifications. I've already checked the typical mod sites. Anyone have any ideas?

Source record: 24822

I have for sale a very nice JRC JST-245 HF+6 Meters Transceiver. This one is in exceptional condition. It was recently sent to Universal Radio for installation of the High Stability Crystal Kit, a new Lithium Battery, and a complete checkout(documentation included). JRC Radios are a cut above the rest. I have 3 of them and am very pleased with their performance. See the Product Review in September 1995 QST for a glowing report. The transceiver puts out 150 watts, has a built in Power Supply, and has the prettiest front panels of any radio around. Price is $1375 including the original box, manual, power cord. Thanks, Charlie Hugg, K5MBX

Hi,

I'm looking for the knob and "collar" (I don't know what you call it) that is the PBT and Notch control for an R71a. Icom is out, and I'm hoping to find someone who has a dead R71A, or one of the other Icom radios that use the same knob and collar. The guy I biught a used one from tried to clean it and ruined them, they basically fell apart after getting dunked in whatever it was he used.

If you have one, let me know...

TIA,

BDK

I'm test driving a Kenwood TS-440. The rate of tuning with the knob is 50kHz per revolution on AM, 10kHz on SSB, regardless of speed. Reading the manual, it is implied that slewing
faster increases the step speed. Can anyone confirm this normally happens? Thanks.

I'd say get rid of that piece of junk and get the Tentec 2 meter radio kit,
I built the 6 meter version and it went together like a charm.

Someone here locally had the Ramsey 440 kit, and after building it and
finding that it wouldn't work found out that the design was flawed from the
start and it could never work.
thanks, John.

The ten-tec kits look way better but I've never built one myself...

> Someone here locally had the Ramsey 440 kit, and after building it and
> finding that it wouldn't work found out that the design was flawed from the
> start and it could never work.

But I did build and test an FX-440. It can work but not very
well. If you ever hear one on the air, listen to how higher the
background noise on the modulation is, the result of using a fairly
noisy op-amp audio chain to directly modulate a VCO with a
sensitivity of like 10MHz/1V... It's no better than a toy.

Good luck.

Dana

I'd be more concerned about the potting compound problem. You may want to inquire as to whether or not it has been removed and the VCO's retuned. It will be a major headached down the road if it hasn't.

Good luck

Hi all,

I have a Weller WTCPS soldering station with a 201U power supply and 201P iron, using a 700 degree F tip. Last night I powered it up in preparation for soldering some connectors, and a few minutes later I saw that the tip and metal shaft of the iron were glowing red-hot.

Any ideas as to what is causing this, and will it be cheap to fix? Are there any checks I can do to diagnose the problem? Or should I just dump the thing and buy a new one? I bought the station over 11 years ago, in practically new condition, at a yard sale for $5, so I got my money out of it, but if a reliable fix is cheaper than purchasing a new soldering setup I'd rather go that route.

Thanks!

-Josh, AE6IQ

Weller sells, through distributors, replacement parts. I suggest that
you replace the temp-sensing tip element, as a start.

A bad thermostat is a likely cause.

I would guess that the fault lies in the iron, not in the station base.

If I recall correctly, the station base is simply a stepdown
transformer. It plays no part at all in the temperature regulation.

The temperature is regulated via a rather elegant (I think)
implementation in the iron. At the base of each tip, there's a slug
of a ferromagnetic material. The properties of this slug are
controlled during manufacture, so that it will change from a magnetic
to a nonmagnetic state at a specific temperature (e.g. 700 F).

Inside the shaft of the iron there is a switch with a magnet on the
end. When the tip is below its transition temperature, the magnet is
attracted to the ferromagnetic slug on the back of the tip, the switch
is pulled forwards, the contacts close, and current flows through the
iron's heating coils. When the tip reaches its desired temperature
the ferromagnetic slug becomes non-magnetic, the magnet in the shaft
"loses its grip", the switch is pulled backwards by a spring, the
contacts open, and the current to the heating coil is interrupted.
You can hear (and feel) a gentle "thick" when the magnet switch pops
back and forth.

It's a nice negative-feedback system. It allows the use of a rather
high-amperage heating coil and transformer (which can heat up the tip
quickly when powered on, and restore heat taken out of the tip by the
soldering process), and yet allows any of several temperature ranges
to be selected by changing the tip. It seems to be quite robust...
I've heard very few reports of failure.

It seems that you have a failure. I would guess that the switch has
failed... either it's become jammed, or the spring has broken due to
metal fatigue. [It's possible that the ferromagnetic slug has somehow
magically changed its properties and now has a transition temperature
several hundred degrees higher, but that seems _very_ unlikely to me!]
In any case, the heating coils are running full-time - you've got no
temperature regulation - because the switch isn't opening.

> Are
>there any checks I can do to diagnose the problem? Or should I just dump
>the thing and buy a new one?

You can probably replace the switch (or, worst case, the whole
iron-and-handle assembly) for rather less than the cost of a new
station. The transformer and line cord, and whatever tips you may
have purchased, are almost certainly OK.

It might be worth disassembling the iron, and seeing if a sharp "rap"
on the side of the iron shaft will dislodge the switch.

If not, you could check with Weller to find out about getting a
replacement switch. The current incarnation of this product is the
WTCPT, using a TC201T iron. Mouser sells the complete TC201T iron for
around $72 (roughly half their cost for the whole station). The SW60
switch for this iron sells for around $26 - you'd probably need to
check with Weller to confirm that this switch is the same one used
in (or is compatible with) your older 201P iron.

$26 to restore this station to full life would be a very worthwhile
investment. I spent about $100 for a WTCPT iron close to 15 years ago
and have never regretted it. I used to go through cheap $15-$25 irons
every couple of years, through cheap tips a lot faster than that, and
I'd burn up components (or have difficulty getting a clean joint) and
cuss a lot. The WTCPT hasn't hiccoughed even once, and I have yet to
have to replace the original tip which came with it.

Agreed, had it happen myself. Not sure about the specific model but
ISTR the thermostat is in, and indivisible from, the element.

The "bit" has a lump of Iron with certain temperature chararistics (
peltier effect ?). When the temperature exceeds the Iron magnetic
ability the element switch, (with a magnet on the actuating arm),
drops out until the Iron, (this is the Iron on the bit), regains its
magnetic ability.
KISS in its best form. I have managed to "unstick" the magnet before
now, but its a bugger to do.
Sorry I can't describe the operation in a more scientific language,
but I'm sure someone will ba able to... ;-)

I've heard this sort of Iron referred to as a "Curie Point" Iron. Is this
the same thing?

Probably so. A material's Curie point (or temperature) is the
temperature at which, when heated, the material ceases to be able to
support/retain a magnetic field, and any existing magnetic field is
randomized.

Heating a permanent magnet above its Curie temperature demagnetizes it.

The slugs used in the Weller tips have Curie temperatures of 600, 700,
or 800 degrees F (plus or minus a bit, I imagine).

4970. Knwd TS-830S Alignment Question/Problem (PLL/VFO)

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-18 20:05:38 UTC
From: Bill Graham <bill_graham__NoSpam__@mindspring.com>
Message-ID: <vu42a89jqdlfc2@corp.supernews.com>
Source record: 24843

The TS-830S service manual's alignment procedure, Step 9 ("VCO adj & check") contains the PLL coil adjustments for the various bands. The procedure calls for a frequency counter and DVM.

Here's my confusion/problem: the measurement point for the frequency counter is shown as:
RF(PLL) - TP3(D40)

I interpret this to mean EITHER:
TP3 on the RF assy, OR
D40 on the PLL assy

But, perhaps I am mistaken ... I see a vast difference in the signal levels at these two test-points.

The signal at PLL-D40 appears to be correct (i.e., when I align the tuning coils specified to produce a 4.00 VDC level on the DVM at PLL-TP1, I measure a 1.058 vrms signal at PLL-D40).

But, the 2nd step in this section then calls for a check of the signal level at RF-TP3 to be 1V (+3/-2 db).

But, the signal level at RF-TP3 is so weak as to be almost un-readable (I measure ~5.0 millivolts).

Final info: I measured the signal level on the RF assy at the junction of L44 and L40, and it is approximately 95% of PLL-D40 total, so I know that: a) the VCO cable carying the signal is making good connection and not hi-Z, and b) L44 is NOT open, c) C61 is NOT shorted, and d) L40 is PROBABLY not hi-Z.

Which all leaves me with a partial (or full) short at RF-TP3 (what _should_ the inductance value be of the primary of T3 on the RF unit be?), or am I simply not interpreting the alignment test-points and procedure correctly?

BTW: the frequency at PLL-D40 is ~1500 Hz too high.

Anybody have any ideas???

For sale, above with original manual. Unit is operational but the little (0-60?) screws that go in the end of the probes are both missing. They were missing when I purchased the unit 8 years ago, manage to insert a tinned piece of #22 wire from time to time when I use it.

Surplus to my needs now with a vector network analyzer, will sell for anything better than what I can realize out of trashing the thing for the cabinet. Shipping from 28739 NC will be a consideration, it's heavy as sin. Manual says 35 pounds, I think it ran something around 1000 pounds on it's way back to my car.

It is VERY EASY to fix / repair the Weller WTCP units.

First, Are you positive you have the CORRECT TIP in this iron.

It MUST BE A Weller "PT" style tip - other Weller model tips such as the ET series will cause this problem and damage the iron.

Josh -

Let's deal with your problem and Facts.

The WTCP series base only provides 24 volts - that's it - its a transformer
in a base.
The "brains" of the temperature control is the tip working in concert with
the SW60 switch assembly
The WTCP series has a unique click as the SW60 switch engages and
disengages - turning the heater on and off to maintain
the specific temperature engraved on the base of the removal tip.

The Red-Glow tells you 2 things:

1. The heater (Weller EC234) is still working (but you are shortening its
life operating in this manner - cherry red)
2. The WTCP series temperature control (which works with the "PT" tip and
the SW60 switch) is not working properly.

Recommend: Change tips. Improper tips will cause this problem.
Get a Weller PTA7 (which is the standard tip shipped with this iron).
The barrel net (BA-60 may also require replacement.

If iron exhibits identical problem - then the SW60 requires replacement
(shorted closed).

All parts for this specific model (WTCPS) are available from Wessco (So. California).
Wessco also just ended a 1/2 price sale on Weller "PT" series tip in November ($ 2.25 each)

I also have the Weller Tech Sheet for this model -- if you need a copy. This has part numbers, diagrams and troubleshooting advice (shipped with every unit new)

Yes, I will consider repairing for you - but it would have to be after the holidays.
Greg
Repairing the Weller WTCP series since 1975

The only heat sensing element in the WTCP? series is the lump of metal at the tail end of the tip. The correct tips for this iron will have a separate bit there with a single digit stamped in it. That's normally a 7, for 700 degrees F.

The alloy of this lump is chosen to have a Curie temp of 700F and it will never change.

There is a magnet that runs down toward the tip and is attracted to the tip when the tip is below its Curie point. Once the temp reaches the Curie temp the lump no longer attracts the magnet and the magnet is pulled back upwards by a small spring. This opens a switch in the handle and turns off the heating element.

The usual problems with these are that something gets inside the sleeve behind the tip and jams the magnet so it can no longer move, or the switch contacts weld closed.

With the iron off and cold you can remove the tip retaining sleeve. When you pull the tip out you should feel the pull of the magnet and then feel the switch and magnet snap back into the barrel once the tip is too far away to attract the magnet. You should repeat this to verify that the magnet is free to move.

If you unplug the iron from the base and put an Ohmmeter on the pins of the iron, you should see the continuity come and go as you take the pin in and out.

Weller is owned by Cooper Tools and PDF files of replacement parts are available on their web site.

Mike -

Sounds like I will have to get the scanner (for Acrobat Reader creation)
warned up this weekend - :-)

The Weller Tech Sheets (WTCP/ WTCPL; WTCPN; WTCPS and WTCPL) were available
directly from Weller (free) --
but have not asked for them --- since the factory was moved from the
Carolinas to Mexico last year.

Bugger me - I'm glad you lot are not troubleshooting a nuclear power
station!
The Weller WTCP must be one of the simplest decent temperature
controlled irons on the market, mine runs 15hrs/day and does so year
in / year out. Sometimes more when I forget to turn it off - the new
ones dont have the neon in the mains switch so it does happen - I have
2 of them now, one on each bench...

Test procedure.

1. Runs continually, therefore base station and element OK.

2. Check switch - unscrew bit retainer and remove (iron off). Pull
tip in and out - should hear click if switch working. If not, then
switch or tip faulty.

3. LOOK at tip, see if mangnet thingo at bottom has fallen of - if so,
buy new tip (and after all the years youve had it, I wonder if it
could solder anything except 2 wires together, my tips last about 3
months on average, I buy them by the half dozen). If tip defective,
completely dismantle iron and remove magnet from switch assembly.

4. If tip OK (go on, be a devil, buy a new one anyway....) then switch
faulty. Buy new one.

5. Exception to item 4 - if you have done bugger all maintenance to
your iron, clean the garbage out of the barrel - it is rare for
switches to fail "on" (never had one do it, as a matter of fact, but
have only been using Wellers for 20 years so it COULD happen...) - use
a bamboo satay skewer to clean out the crap, then follow procedure 2.

Hope this helps,

de VK3BFA Andrew (at 50, an "official old grump")

I have heard this from some other user - but I have tips that last years -
BUT I
only use the 700 degree tips.

> 4. If tip OK (go on, be a devil, buy a new one anyway....) then switch
> faulty. Buy new one.

A spare tip should always be available on the bench. I just repaired an
older WTCPN station
an the college student had placed an "ET" tip (aka tips are all the same
right! - wrong)
from the Weller EC1000/EC2000/WES50/WES51 models.
Glowed cherry red -- changing to the proper tip -- corrected problem.

> 5. Exception to item 4 - if you have done bugger all maintenance to

I saw my first internally shorted SW60 last year (although I think the user
had wacked it against a hard surface to
cause this type of damage). I also have seen a "kinked" spring -- near as I
can tell -- originally assembled that way --
over a decade earlier. I never saw a heater fail as shorted (dead short -
but not heating) until last year -- all previous ones
failed as "open". See enough stations and you see many failures, bad
operating practices and unique equipment abuse.

I want it for the same reason I want manuals for all of my equipment.
It saves a lot of time locating part numbers when you do a repair. I
have used, and repaired, these soldering stations off and on for years,
but I always had to wait for the distributor to look up the part
numbers.

BTW, I don't do nuclear power, but I did build and test telemetry equipment used by NASA, including a KU band receiving system aboard the International Space Station.

The Weller stations were banned from the production line because of a surge in leakage current when the thermostat tripped in the heating element, and we were required to use irons with grounded tips that could reliably measure under three ohms from the hot tip to the electrical ground on the bench. They were replaced with Ungar "Loner" irons with electronic temperature control.

I used a spare DMM connected between ground and a piece of scrap copper to quickly test the resistance any time any of the three irons had sat idle. I used the irons so many hours a day they tips only lasted a few weeks before the iron plating was pitted, and would no longer go below three ohms. I threw out a lot of tips that could have been used in non ESD situations, but we couldn't risk someone reusing a bad tip, so they went into the recycling bin with other solder related scrap.

I have five dead Weller soldering stations I picked up that will need new irons, after someone tried to "Fix" them, and left the irons in pieces.

Have you posted this question to the TS830 Yahoo group? They
could probably answer this immediately.

Go to yahoogroups.com and look for this group to join:

TS-520_820_530_830

Regards,
Ken WB6QWF

On Thu, 18 Dec 2003 15:05:38 -0500, Bill Graham
<bill_graham__NoSpam__@mindspring.com> wrote:

The TS-830S service manual's alignment procedure, Step 9 ("VCO adj &
check") contains the PLL coil adjustments for the various bands. The
procedure calls for a frequency counter and DVM.

Here's my confusion/problem: the measurement point for the frequency
counter is shown as:
RF(PLL) - TP3(D40)

I interpret this to mean EITHER:
TP3 on the RF assy, OR
D40 on the PLL assy

But, perhaps I am mistaken ... I see a vast difference in the signal
levels at these two test-points.

The signal at PLL-D40 appears to be correct (i.e., when I align the
tuning coils specified to produce a 4.00 VDC level on the DVM at
PLL-TP1, I measure a 1.058 vrms signal at PLL-D40).

But, the 2nd step in this section then calls for a check of the signal
level at RF-TP3 to be 1V (+3/-2 db).

But, the signal level at RF-TP3 is so weak as to be almost un-readable
(I measure ~5.0 millivolts).

Final info: I measured the signal level on the RF assy at the junction
of L44 and L40, and it is approximately 95% of PLL-D40 total, so I know
that: a) the VCO cable carying the signal is making good connection and
not hi-Z, and b) L44 is NOT open, c) C61 is NOT shorted, and d) L40 is
PROBABLY not hi-Z.

Which all leaves me with a partial (or full) short at RF-TP3 (what
should the inductance value be of the primary of T3 on the RF unit
be?), or am I simply not interpreting the alignment test-points and
procedure correctly?

BTW: the frequency at PLL-D40 is ~1500 Hz too high.

Anybody have any ideas???

It's not confusing if you check the schematic. D40 is the VCO output on the PLL unit and TP3 is the VCO input on the RF unit. They give 2 places you can measure it.

OK - As long as we have all this Weller knowledge here, who has the secret stash of tips for the W200 iron? Yes, they made a 200 watt iron with the magnetic temperature control, but I have been unable to find parts for many years. Can't find W200 on the Weller web site.

Thanks in advance.

Source record: 24869

I have a very nice Heathkit HW-99 CW Transceiver for sale. It looks almost new. The front panel is perfect accept for a small mini toggle switch installed below the Band
Switch. You turn this switch in the up position to access the 10 meter Band. This appears to be the only modification and the construction of the kit is excellent. I checked it out on all 4 Bands, 80, 40, 15, and 10 Meters. It puts out well above 50 watts on each band. The CW tone is excellent and the receiver is very stable and sensitive. It has a built in 120 Volt Power Supply and speaker. It sounds better on an external speaker.
This is a great little CW rig. All you need is a key and an antenna to be on the air. The rig sold for $300 in mid 80's
and they only made it for a couple of years, so it is rather rare. The original manual in included. See
Product Review in March 1986 QST. Price is $225 shipped in lower 48..
Thanks, Charlie Hugg,
K5MBX

I have for sale a Kenwood TR-9130 2 Meter All Mode Transceiver with Kenwood
MC-46 Touch Tone Mic. Also included is the power cable, mobile mount,
original box and manual. It works great and puts out 5 or 25 watts.
Cabinet is very good. Front panel is showing a little wear, but not bad.
Digital Readout is bright and clear.
Price is $175. Thanks, Charlie Hugg, K5MBX

FS a MFJ 989C Antenna Tuner. This is the high power, 3KW Roller Inductor antenna tuner with build in Dummy Load,
antenna switch, and Peak Reading Watt/SWR Meter. This is the older version with the black cabinet. Included is the Original
Manual. This tuner works fine. It is in good condition cosmetically with a few small spots in the paint. There is a ding in the
aluminum insert of the large Inductor Tuning Knob, not bad. Price is $195.
Thanks, Charlie Hugg, K5MBX

Well, I don't operate with it cherry red. This is the first time it's done
that--hence my knowing that something is amiss.

> 2. The WTCP series temperature control (which works with the "PT" tip and

I'll take a look and see. The station came with two tips, both #7, but in
the 11-odd years I've owned the iron I've never used the second one.

Message-ID: <cvt6uvsgso20mbiql27j9du7gj4iiteo7b@4ax.com>
Source record: 24875

Here is a problem that I'm having with my Diamond X700.
Hopefully someone can give me some advice on which antenna would suit my needs best.

Problem:

My Diamond X700 cost me $400. I'm using it for a VHF repeater antenna.

The problem it causes is every now and then, I get gurgling noises and crackling in the transmit and it takes out weak signals.

This problem may stay in a few days and be gone for a few days and then come back again.

It is not my TX RX duplexer. That was already checked out.
I replaced my coax with LMR400. (75 ft. run)
I have even changed repeaters and get the same results.

Someone told me that the Diamond antennaes are NOT good in repeater service because they whip around and the rods inside do get broken and cause problems and will not show a bad SWR. My SWR is fine.

Anyone out here have the same problems that I'm having? Do you have any suggestions on a proper antenna to use?

I do have one suggestion and that was to get a Decibel products DB 224 antenna. Their website shows it as 6 DB gain where my Diamond is 9 DB.
I'm afraid that I will lose my receive coverage with the lesser DB gain.

Can anyone comment on the Decibel product? Any help and suggestions would be appreciated.

Or if you can suggest any other antenna that could be used for repeater use at my home.

Go with the DB Products or any other comercial 4 bay dipole antenna. The ones like Comet and Diamond are fine for some home applications . They just will not stand up to being mounted on a tall windy repeater tower. Hate to say it about a product but you bought expensive junk...

The antennna must be getting its gain numbers over a rubber duckey at ground level. There is no way to get 9 db of gain with an antenna about 20 feet long (omnidirectioal) . The 4 bay dipole antenna will give just under 6 db over a dipole if it is correctly made. Colinear antennas will give even less for that length .
Something around 5 dbd is more like it.

Check out the repeater builders group on Yahoo for information. Don't take my word for it , I have only been keeping a repeater up for a little over 25 years.
Go here:

http://www.kuggie.com/rbtip/

and click on the repeater builders technical info page.

BTW they do not think much of the lmr400 due to problems like you seem to be having. The braid and the foil reportably flex in the wind and make that kind of noise in a duplexed system. I am running a repeater that for the last 2 years that has 100 feet of lmr400 on it and I am not noticing the noise. It may take a rew years to develop as the brade loosens up . I don't really know. I do know that if you have loose guy wires or other loose hardware on the tower you will get the noise in the receiver when the transmitter is on. I did have a guy wire problem one time . Tower is 100 feet of Rohn 25G With a stationmaster on top . The top guy wires on the ground anchor had about 3 feet of loose ends. When the wind whipped the ends back on the guy wire going to the top of the tower I had noise like mad.

OK, Rich. Now I have a question, and possible beef! You have previously stated you purposely don't put the "http" in front of URLs for your E-Bay auctions in order to keep AOL happy, yet in the posting below, (and others), you do have bona-fide full URLs listed below the E-Bay URL. If you can do this, why not do it for the E-Bay listing too? It would make it a whole lot easier to just click on instead of copy, past, and add. I skip some of those when in a hurry.

You might want to test your theory by swapping to another, even smaller antenna just to see if the problem goes away. I agree with the other post that the Diamond is not as much gain as advertised and an exposed dipole array is about the most omni gain you will find for the size.

I have seen a suggestion of using the Hustler 2 meter base antenna as an antenna for repeaters as they are fairly rugged. The person that was saying this claimed that eventually the harness on the exposed four bay antennas will deterioate and even though the SWR would look good the gain would go in

the dumper. The group that states the Hustler is good is the South East Iowa Technical society. Use Google to look up SEITS and they have some pointers for setting up repeaters.

I have picked up a number of NOS Weller items (no longer in production) this
past year (from a number of sources) --
due to the relocation of the Weller production facilities in the Carolinas
to Mexico.

You can call Weller (North Carolina) and ask for Mr. Larry Smith (who is
Weller's product line manager and engineering support)
IF Weller is no longer making the part, Mr. Smith or "Dino" who leads the
repair center -- was know of a source !

> Any other sources for that expensive transistor?

See http://www.mods.dk/mods.php3?radio=yaesu&model=ft-100&selectid=all#2205 for info on transistor replacement substitutions, etc. Also, when you replace the final, be sure to also perform the "heat mods" http://www.k0lee.com/thermalmod.htm . Otherwise, the replaced final will also die in short order...

5017. Heil HM-10 ships with no case now ????

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-20 16:20:55 UTC
From: massimj@hotmail.com
Message-ID: <e9d3dd29.0312200820.eace674@posting.google.com>
Source record: 24890

I received an HM-10 from Universal-radio and it did not come with a case. I called them and they said that the HM-10's they have do not come with a case from HEIL.I checked the Heil web site and thye say it ships with a case. Has anyone ever gotten one with a case? Did they change the policy and just not modify their product description? I'm sure that the golline comes with a case as stated in the description, so there is no need for anyone to mention the other models. 73' Joe

5018. Re: Help on repeater ant to buy

<< I have seen a suggestion of using the Hustler 2 meter base antenna as an antenna for repeaters as they are fairly rugged. The person that was saying this claimed that eventually the harness on the exposed four bay antennas will deterioate and even though the SWR would look good the gain would go in the dumper. >>

Ritchi & Al-

Gain isn't everything, but having a higher number sells antennas! Some companys use the higher dBi number. Others use dBd which is 2.1 dB lower. Although engineers are taught antennas from the isotropic point of view, I believe it is an industry standard that the dipole be used as a reference for VHF and UHF two-way radio antennas. The dipole certainly is more practical if you want to measure gain.

I've used the Hustler G6-144 successfully, but don't consider them especially rugged. The fiberglass deteriorates in the weather. Mine also got beat-up by some tree limbs! I had the repeater on for several years and eventually replaced the antenna with another G6-144.

Another repeater that used the G6-144 at a higher elevation (top of a city water tower), had a couple ruined by lightning. The phasing coil just vaporized in each case. After having problems with a Diamond, they switched to a used commercial DB 4-dipole antenna, and have had excellent results. One lightning strike took out some of the equipment but didn't seem to phase the antenna.

If you go for the 4-dipole antenna, be sure to get the one with the phasing harness INSIDE the mast. Otherwise you will probably have troubles with deterioration, as Al noted.

I have a new in box Motorola M1225 LS 25-40Watt Mobile Unit,
MINT/UNPROGRAMMED. still with mic and clip, hardware, manual, and safe op
manuals. The split is 450-470 UHF. Never programmed. Photos upon request
Model # M44DGC95A2AA
asking $275.00

With whip rubber duckie, Kenwood rapid charger and 1 good battery.
I will sell for $90 shipped CONUS. Photo upon request

Also for sale, cleaning up:

I was given a new RS pro-96 for a present. We do not have digital
here. I am selling it since I already have a BC780XLT. The package
is complete from RS, box, manual, antenna, clip and regulated
external PS. I will sell the package for $475 shipped. POSTAL MO
only.

Also, 1 pair (2) Motorola 2 channel Radius P110 with 1 good battery (new one
costs $30) ,
antennas, 2 chargers.
Model #'s P44QLC20A2AA

Asking $220 for the set OBO

Photos of
all units available. Postal MO preferred. I do not use paypal. I will
consider COD if paid by buyer.

Got a used Yaesu 757GX from Ebay and it could use an alignment and the
battery needs to be replaced.
I don't want to send it to Yaesu or AES/HRO ect. Looking for a person in the
Toledo Ohio/Detroit Mich area that likes to work on HF radios and can put
the type of time/quality into work that these other places don't.
I am retired and willing to drive to such a person to minimize the hassle
and cost of shipping.
Thanks 73 Steve

Hi, everyone. I on the hunt for some information around the final
tubes for a ft-901dm. When I power up the unit, one of the tubes(closer to
the
front) starts to glow bright red(heater of course) compared to the other
tube.
I've tested both tubes before they were installed and both passed(no shorts,
etc.).

So I'm asking for some help from the tubers in the community on this
one.

thanks for looking,

Lee

5026. kenwood if-20, rc-20, tm-241 and tm-441

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-21 07:46:28 UTC
From: Allan Butler <ka0ies@hotmail.com>
Message-ID: <ndcFb.611403$Tr4.1591394@attbi_s03>
Source record: 24749

Hi there:

I am having some difficulty with the setup that is listed in the subject line of this posting. I have the RC-20 connected to the IF-20 and then the two radios are connected to the IF-20.

I have searched on Google under IF-20 and RC-20 with Kenwood included in the search window.

The problems started out with the display on the TM-241 doing the flickering and disappearing tricks. I fixed that and have it working again. So when I put it back in my truck I couldn't get both radios to work on the RC-20. One radio worked fine and the other one didn't. It turns out one of the cables from the IF-20 to the radio mic connectors was bad. It turned out to have two broken wires. I have repaired the cable and gotten it so that it is correct.

Now what is happening is that I can only operate one radio at a time. If I try to operate both radios it is almost like the communications between the first radio and the RC-20 is being interfered with by the second radio.

I can turn on the VHF radio by itself and it works fine. Then I will turn that off and turn on the UHF radio and it works fine. But if both radios are on the first one that was turned on will sit there and blink the display on the last thing it was showing and the second radio will turn the lights on in the display but not show information on the LCD.

To me it would appear that something to do with multiplexing the data that is going to or coming from the radios is messed up. Does anyone know if this would be located in the IF-20 or in the RC-20 unit? I would really like to get my radios working properly in this setup and not have to choose one band over the other.

Any help would be greatly appreciated in this matter. Even if it is just a suggestion of a web page to go look at.

Thanks in advance.

Al Butler

Source record: 24756

Has anyone measured the current drawn by the FT-90R on transmit at the lower power output levels, i.e. 25, 10 and 5 Watts or otherwise determined what's needed? I'm planning to operate mine at 10 Watts because of the reports on overheating, to reduce the near field intensity and in order to operate it from the car's Cigar lighter socket. And, I'm a QRPer at heart.

Message-ID: <3FE62CED.7E6@nbnet.nb.ca>
Source record: 24757

Why don't you measure it yourself Cal? Others, providing you with measurements, might be ok - ballpark - or way off due to things like system voltage, using an antenna which may or may not be well matched and/or a mode that's different than you'd use. Although it's tempting to use that cigarette lighter socket, I'd strongly recommend against it due to the general poor connection they afford (and the poor connectors available generally!)...not to say it won't work for you of course.

Your own basic measurements like this will also add to your knowledge base and reinforce your theory with practice.

I'm enjoying listening to "Santa" this afternoon. At 19:24 UTC on 18.114 mhz. This is one of the finest services I've witnessed in my 30 plus years of being invlolved in amateur radio. And there has been a tradition in my home with my children QSO'ing with W6S/"Santa" for a number of years. W6S/Santa has actually been doing this for 32 years!!

I'm privilaged with perfect propagation this afternoon, so I'm able to hear the little kids respond to Santa. One of the little peanuts just said "I love you" out of the blue. I think it took Santa back a bit and he got a little teary-eyed.

Good stuff. Give's me a little bit of hope for humanity.

73 and Merry Christmas!

Actually Collins radio used the original TCP stations (black bakelite) on
their productions lines and for repair in the 1950s and 1960s
(5 of these from Collins surplus were the first ones that I repaired in
1975 - as I started college)

The original ones did not have the switch OR neon bulb ... and they ran 24
hours/day at Collins.

Darn shame, but components have changed as well as their tolerance to ESD.

> I have five dead Weller soldering stations I picked up that will need
> new irons, after someone tried to "Fix" them, and left the irons in
> pieces.

I assume the later WTCPS and WTCPT models? In addition to the ESD
requirement, "T" model changed the 3 amp fuse
on the transformer's secondary (to protect transformer from a heater short)
to a 6/10 amp fuse on the transformer primary
(and an MOV across primary on some models).

I seem to have a memory channel that says "MRP" instead of "MR", while I don't see anything else different I just need to know "What that means!".

Perhaps that's the Priority memory spot?

That would be the "priorioty" memory channel I would think.

A 'commercial' antenna like the STATION MASTER cut for ham freqs is a much better choice than a Diamond. It costs more, but you get what you pay for.

3. Press the [band] key. When rotate the DIAL to select the "Priority"
channel, a "P" icon

(for the "Main" band priority channel) or "p" icon (for the "Sub" band
priority channel)

will appear to the right of the "MR" icon, indicating it is the Priority
channel.

I don't know which model they were using. They were pulled from the
production floor a year before I was hired. They were in storage in a

separate building, and I was never able to get my hands on them They were probably destroyed last year when the plant was closed and moved to Pennsylvania. I kept hearing the old timers complain about the new irons because they had used the Wellers for years, and didn't like to do the extra maintenance on their "Loner" irons.

Source record: 24774

Be VERY VERY careful with the FT-90R. My first one was destroyed by fire (the god damn thing burned up). Yaesu said it was a shorted regulator and did replace the entire radio and accessories. The second one didnt hear worth shit, tended to overheat and finally flat out died in 3 weeks. I tore that piece of shit out of the Explorer and replaced it with a Kenwood TM-G707A and have been VERY happy. No overheating, good RX and a much tighter RCVR that can hear weak signals. Hell will freeze over before I buy ANY new shit from Yaesu...
Current line up....
TWO Icom IC-706MKII-G's (Great radio)
Icom T7H good radio
Kenwood TH-F6 not bad, could be a little better on RX
TWO Kenwood TM-G707a's both in vehicles
Motorola System Sabre-3 handheld (workhorse)
Yaesu VR-120 (ok, nothing special..does it's job)
Icom IC-Q7 (cheap playtoy, but hears GOOD)
Alinco DJX-10 (workhorse, crappy battery setup)
Yaesu 5200 mobile (dial lights dead, fan dead, poor RX..is now a Echolink base radio)
Kenwood TM-741 mobile (tired piece of crap, no TX on 2 meters, 6 meters is deaf, 440 RX sucks, now used as a doorstop)
Radio Shack (Maxon) HTX-202 (Good RX!! one of the best, big as a brick has been beaten to death and still working)
Radio SHack HTX-10 (10 meters) (OK radio, audio on FM sounds muddy)
Read the radio reviews on www.eham.com and see what others say. For the most part Yaesu is cranking out shit for radios, look at the FT-7100 (hahahaha) a worldclass crappy RCVR. The 8100's suffered from crappy circuit board design with intermittant plate-thrus. The FT-100's had audio boards that burned up. FT-100D's are problem prone too.The ONLY way Yaesu will get a clue is when the Amatuer community stops buying this garbage from them! Yaesu CAN build some good equipment. They do it under the "Vertex" nameplate. That stuff is heads above the sloppy,crappy dual conversion RX, undercooled(and designed) crapola they shove up the amatuer's butt....Eddie

I have built several of the Ramsey and sorry to say that the other
guys were right. I never was satisfied with any of their performance.
I also have built a couple of the Ten Tec kits and found them to far
superior to the ramsey units.

Just my 2 cents.

I knew a fellow who has similar troubles with cars. "Don't buy a Chevy, mine burned up 3 motors! And don't buy a Ford or Chrysler product - I've never been able to keep a transmission in a Ford and Chrysler axels break all the time! But whatever you do don't waste money on any foreign piece of crap - they never last me more than a few weeks! ...."

OTOH we've had two FT-90s in cars for years and FT-7100s in our motorhome and house plus a FT-5100 in the den with zero problems on any of them. But then I have over 150,000 miles on my Harley and the old Alinco on its handlebar and I just gave away my old TS-120 that rattled around in my PU for 20+ years so maybe I'm doing something wrong.

Please tell me how to get radios to catch on fire so I can justify something newer (c:

> Anyone have any experiece with the Elecraft K2 and K1?

I don't own one personally, but I've used them before and I like them. I'm a CW op, and the K1 is a fantastic little rig. I'd like to own one, but don't have the $$$ yet!

Other people that I've spoken with like their Elecraft rigs as well. The reviews on eham.net are very positive, and from what I understand if you need help constructing the kit there's no shortage of assistance.

5060. FS: Sierra 121 Tunable VTVM/VLF Rcvr

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-22 16:58:58 UTC
From: Walter Treftz <pendragon@netsignia.net>
Message-ID: <3FE722BD.7B2EBC46@netsignia.net>
Source record: 24784

FS: Sierra 121-A, tunable VTVM

Freq range: 10khz - 510 khz

Controls:
Attn Steps: -60/.001, -50/.003, -40/.01, -30/.03, -20/.1, -10/.3,
and 0/1
Input Level: 0/1, +10/3, +20/10, +30/30, +40/100
Injector Sw: CAL & REC
Meter Sw: CAL & REC
IF & AF gains
Headphone jack on front panel
Meter Scales: -10 to +2 db, 0-1v & 0-3v

Comes with manual copy and my parts replacement notes.

I got this at a hamfest with intent of using for VLF rcvr. Bought
a manual and started replacing parts (leaky caps, out-of-
tolerance resistors, etc) even though it was working (having
never used one, had no idea if it was working well or not but
signal generator punches through). THEN, couple weeks ago picked
up a Sierra 128-A (same gadget) at another 'fest and it appears
this is the one to keep (rack-mount like rest of my station,
solid-state, much larger freq range - DC to about 15 mhz, etc.)

Can send digital pix if desired.

If interested, make a reasonable offer. Buyer pays shipping.
No extra charge to pack up and haul to USPO or UPS. If in central
Florida, can deliver (Gainesville to St.Pete)
for gas or beer.

Any questions, contact direct at --
--- pendragon@netsignia.net
--- hvalver/at/hotmail/dot/com
--- rosemarytreftz/at/yahoo/dot/com

or (352) 637-1755

73 Walt (N4GL)

BTW, if anyone reading this has a 128-A and the manual, would
like to hear from them re getting a copy.

5061. Kenwood TM-231A Schematic Needed for Modification

Hi,

I'm in need of the type and/or part number for the
subject plug so that I can order one. It is a white nylon,
24-pin affair, with a couple of locating notches and a
chamfered corner. It looks like some kind of auto spare.

If anyone can help me find this, I'd appreciate it. I
have looked in a couple of on-line catalogues but the ones
that have turned up are close but not exactly the same.

While you're at it, check one more thing! If the problem turns out to be welded contacts on the thermostat switch, check that the MOV across the secondary of the transformer is still good. I had one that repeatedly welded the contacts till I replaced the MOV and has worked for 5 years now without a problem.

MRP is the priority channel - when you use the dual watch feature, the DW key, the radio will scan from any one channel back to the MRP channel every five seconds.

There is a lead here.
http://www.hayseed.net/~jpk5lad/IC-720/720Index.htm
Can't tell how old it is.

I also have an Icom OPC-137 cable which has the 24-pin connection on one end, and the output is split into two DIN connectors. One is 7-pin, and other is an 8-pin connector. They were originally intended to interface the IC-751A to the AH2, 4KL or AT150, but could be used with many radios with the 24-pin accessory socket. This one is brand new, and I would be willing to sell it for ($20, what I paid for it) plus shipping.

Here is the mod for the board version I have in case someone else is ever interested.

"The only modification I show for reducing spurs on the FX146 Rev. 1.3 is to place a 0.001 uF capacitor from TP1 to ground."

I figure if it even works - that is good for me as this was a lesson in soldering. With what I've learned from the different kits I've been working on, I'm ready now to tackel my Elecraft K2

There are no rectifiers in the WTCP series base ... all AC. Weller does
make a heater for this series that
works at 12 volts (DC) for mobile work.

The battery in this discussion is a glass-mat gel cell... a far superior battery for radio use over a Marine lead-acid type. It will last much longer, and requires less care. Glass mat batteries also don't vent gas nearly as much as the marine battery making them much safer if located in the ham shack.

I have a K1
I was on the air with it about an hour ago.
Pretty amazing little rig!
Easy to build
I used a higher quality pot for tuning.
Same basic thing...just higher quality.
Made by Bourns...bought from Mouser.
I built my K1 with the noise blanker and antenna tuner option....and
another option that I can't remember!!!
The rig worked right from the start.
If I were to do it again, I think I would get it with the pre-wound toroids
(coils).
It wasn't hard winding them...just tedious!

The MOV (Metal Oxide Varistor) is a surge supressor whose only function
is to absorb the "kick" when the mechanical thermostat opens (or
"bounces" when closing). The one in the Weller unit (if memory serves)
clamps the voltage at about 40 volts (Transformer secondary is 24 VAC).
If it isn't working properly the thermostat contacts arc and weld shut,
causing runaway overheating.

Don't worry, Jim. Since that information is hidden away in the "scanning" section of the manual (page 61 in mine), and the "P" for priority channel only casually mentioned there, it's fairly easy to overlook. It will take some time to learn all the features of this radio, and then you have to remember it all when you take the radio portable (oh, my, which buttons do I push to...). Perhaps the radio needs a memory bank just to store a condensed version of the manual, but we'll probably then need a manual just to figure out how to operate that.

==========
Harvey , Tnx for the useful info . I was interested in the spike voltage
suppression level of the MOV, which is required since the heater element is
for AC . In the event of DC a reversely connected diode would have done the
trick .

Damn right - because I don't use my VX-5R every day, I have only the basic operation characteristics memorised. If it required some of the more advanced operations, then I have to go running for the instruction manual or have a play and risk making some really weird changes to the radio - have found it trying to call other radios all by itself sometimes (damn buttons and functions), and had weird settings occur, but overall, it has been a very good radio.

This is why recommended SOP is to carry a copy of the manual in your
emergency kit.

I've had trouble because I program my HT with my PC, and others at
various events have needed help with manually programming the set of
event frequencies.

Hi,

I have an FT-1000MP, the original, not Mk-V, not field, vintage is 1999. Recently I have noticed that if I turn the radio on 75 meters, the receive is low.... until I just tap the mike or key, then the signals jump up 10-20db, stay there for a while, and eventually, after 4-6 minutes, fade down, until another mike tap is applied. This will continue all night. Antenna is a resonant dipole. It seems to happen only on 75/80... preamp problem? should I switch to flat? Suggestions?

Thanks!

Perhaps you're building up a static charge on the antenna in the dryer
winter weather? Then when you transmit it's being discharged? Not sure if
this would be workable with a transitter in line, but I used to put an NE-2
neon lamp across the antenna/ground connections outside (no series dropping
resistor). This would only let the static build up to about 70 volts before
discharging..

Yep, I have made up a portable setup consisting of two monoband radios (the Yaesu FT212 and FT712) on a carry box containing an 18 AH gelcell with two antennas on it for low power useage. I have also wired it up for connection to an external power source and have the ability to recharge the battery at the same time. Bit on the heavy side so I wouldn't be wanting to carry it around to much though!
I also have a couple of handhelds as backup which I do know how to use quite well, with knowledge to perform most of the functions in my head. The VX-5R whilst a greta radio is not as easily used - thus my comments below. If I took a copy of the manuals for all of the radios in my cruiser, and all the radios I take for events, then I would need a seperate box just for them - and as it is, I usually end up taking far more than I need. Ah well, just a hobby......

hhhmmm, could it be a dirty (or bad) relay? I have a Yaesu FT-102
(vintage around 1984 or so) It had trouble with one of the relays till it
were replaced.
It had the same symptoms as you describe.
Give Yaesu a call and ask for a tech.
Good luck.

It's here, or nearly so. Just 28 minutes to go.

I'll be sleeping 'for midnight, but for Santa I'll leave on a light.
For the reindeer I'll leave kimchee out
For Santa nice rice cakes
We haven't got a chimney
So I'll leave the door unlocked
And a note by the tree
Saying "Careful, don't get shocked!"

But seriously.... let us never forget the significance of this day. Beyond the commercial hype, the naysayers, and the evil wrought by men.. we need to thank God for sending His son to us, so that we may have our sins washed away, our souls cleansed.

Even for those who are not of the Christian faith, there is still significance to be found in this day, as it has become a day of goodwill toward all men. Try as you might to keep this day, and it's meaning, with you all year round.

Bless you one and all. Merry Christmas, Feliz Navidad, Joyeux Noel, Maligayang Pasko, Idah Saidan Wa Sanah Jadidah, Meri Kurisumasu, Mele Kalikimaka, Boas Festas, ??? ?? (Julguh oon sungtan)

May you all have the best of holidays, and the most prosperous and wonderful of New Years.

Take care, all, and stay well.

Hello All,

I have recently acquired a Heathkit Warrior HA-10 Linear Amplifier. This is my first Amplifier. From what I can tell, it is all original-no mods done. I have a HW-101 transceiver that I would like to drive the amp. with. Could someone who has a Warrior that they have modified to include relay for a transceiver please offer some advice? I could really use some guidance as to what type of relay(s) used, part number and where to purchase. I don't want to install something that is going to be a weak link (impedance bump, arching etc.)

Thanks for the help!

73,
Scott KC9AWN

Sir,
Are you an Amateur Radio License Holder? I mean do you have a license?
If not, I doubt that there will be one single Ham in all of the United States who will safely feel that he can talk to you about this equipment. It is that we remember all too well the dismay of those people in the pilot training schools who taught certain people to fly airplanes before September 11, 2001.
The point is this: If you are a Ham Radio Operator, you would already know what this equipment is for. If you are not a Ham Radio Operator, You Do Not Need It.
N6UF
p.s. Please accept my apologies if my concerns are not warranted. It is just that the whole country is still afraid. Our fear is directed toward gentlemen with Arab names. We do not want to aid even the possibility of improved terrorist communications.
N6UF

Actually, they can be used both as an receive amplifier and
a transmittiing amplifier. To test which one you have you can
connect an HF transceiver's coaxial output jack using the proper
cable and connect it to the input jack of the amplifier. Then taking
another HF or VHF receiver or transceiver, connect its antenna jack
to the output side of the amplifier. Turn on both radios and then the
amplifier.
Set the amplifier for the band on which you want to test.
Tune both radios to the same frequency then key up the first rig connected
to
the input side of amp and tune amplifier for maximum smoke.
If the "S" meter on the receiving radio momentarily goes off-scale you know
that you have done it correctly.

Happy Holidays!

Good battery for the price, check what the ups ship charge will be.

Yes you also can buy a larger marine battery but it is not same type
at the one online. The sealed led acid (sla) batteries will not vent gas
unless they are abused or overcharged. Regular batteries will vent and
can spill acid.

Check your local hamfests, there always is a few hams selling the recent
pulls from the large UPS systems in our area. Most get pulled after third
year
of service. I have several yausa 12v 38ah batteries each went for $ 10.00
!

Just replaced 60 12v 7ah batteries out of our ups system at work,
ups guy more then happy to leave the batteries for me to give away.

Perhaps this explains why I keep getting the QSL cards from that pretty lolita in Cancun Mexico, which she swears were not sent by her. The radios are talking to each other instead. Hey, if this keeps up, maybe I'll soon have cute little baby VX-5 around here. ;-)

Merry Christmas, Matt.

Source record: 24740

Thanks for all the replies on my antenna problems.
I have a 41 Foot tower and I'm actually pretty high
at my location, but I'm in a valley here, So for VHF
I need a very good gain VHF repeater antenna.
So I'm asking all the repeater Guru's out here
which to buy: Super StationMaster OR DB 224 Anteena?
I want to put it on the very top of tower.
Which is better gain and less noise,etc.
Hope to hear from people soon.
Thanks and Happy Holidays.....Rich

Why not?

That's what they were designed for. They vastly pre-date CB. They work well with the old tube rigs (for which they were designed). I've used them with everything from Collins and Drakes to Kenwoods and Icoms...why not???????

Have had some good luck with those I bought. I can't say the same for a friend of mine. He bought a receiver kit. He put it together and it didn't work. He brought it to me and I checked all his work. It was fine. I did some testing. The thing was deaf. We even took it to yet a 3rd party for their opinion. Same as mine. My friend called the company and they wanted $70 I believe to test and repair. The damned thing only cost about $30 to start with. It was a piece of CRAP. G.W.

I have built a few. I don't particularly like the order that they use to insert the parts. I have built dozens of HeathKits and their way makes a lot more sense to me: put the shortest parts on first, then go to the taller ones. Ramsey tends to put all the parts in one area, making the board impossible to sit flat.

But the few I built did run just fine.

>Why would anybody put a D104 on an amateur radio?

If it were able to be used as intended, it would allow me to talk without having to be 2 inches from the mic, as is required with my Heil HM-10. Besides, it's a neat microphone, but it's just collecting dust sitting on my shelf.

I'm used to this. You diagnose radio troubles fairly well, what's the point? Why do gay/lesbian/TG/TS folk feel the need to do this? It doesn't make a damned bit of difference. You're a human. Sexuality is a trivial thing. Gays and lesbians have the same types of relationship troubles as straights and I've seen plenty of it where I live. All that is supposed to matter is what we can do for each other...the rest is baggage.

This is another numb moment in a lousy year. Stick to tubes please.

Merry Christmas to you too, Brenda. The life if Christ is to be
remembered every day. One of my favorite verses is:

John 3:16: For God so loved the world, that he gave his only begotten
Son, that whosoever believeth in him should not perish, but have
everlasting life.

I have a white tees shirt with gold letters that says "John 3:16 says
it all"
--

Take care, and God bless.

Someone wrote "> Why would anybody put a D104 on an amateur radio?"

Well -- probably tens of thousands of Hams did well before CB and a lot
still do.
The mic has a rising response at the higher audio end for increased
intelligibility. Read Ham reviews at URL:
http://www.eham.net/reviews/detail/1161

Because you can use the back of the chrome mic as a mirror
to see behind your rig to plug/unplug stuff !

Try talking across the mic not directly into it,
makes a nice difference.

Plus they look real retro !

What a rip off. Parents should know better. Having a birthday at
Christmas time deprives children world wide from getting all the
presents they deserve! I always envied kids with birthdays in June or July.

I used to hate getting socks and underwear from St. Nick. Heck..your
parents OWED you that stuff just because they were parents. Getting them
as gifts was just being short changed.

Parents don't "Owe" you anything more than food on the table, a place
to sleep and decent clothes. They may choose to give gifts, if they can
afford to, but they don't "Owe" them to anyone. If something is "Owed",
it isn't a gift, its an entitlement, like welfare.

Sheesh..talk about taking things too literally. I also said that they
'owed' you things like socks and underwear. Think of it as the cost of
maintenance of said progeny versus the optional gift giving.

Terrell? Any relatives in Calgary Alberta?

I long ago grew weary of the commercialism applied to Christmas.
Every year it becomes harder and harder to fined any evidence of the
true meaning of Christmas. People tell you its our "Duty" to go deeper
into debt to buy horrendous amounts of "gifts". I heard a kid tell his
mother he was going to call the state of Florida's child welfare group
and claim he was abused if she didn't buy him a very expensive toy.

I don't hear any true Christmas music. "White Christmas", "Jingle
bells" and other secular music is not Christmas music. It is simply
politically correct BS trying to mask the fact that Jesus Christ was
born.

Sorry, I don't know of any relatives in Canada. My dad's mother died
when I was little. She was the family historian, going back four or five
generations, so very little of our family history was written down. I
was born in Kentucky, and raised in SW Ohio.

So? I use a D-104 on my Icom 706...and with my old Kenwood 430 and with my old Icom 735...they're neither tube-type nor boatanchor. Nor am I a CB'er. What's wrong with that???

Heh... AMEN to that.... so sad, but true.

There were some really good historical things on the lesser watched channels tonight about the meaning for the season.
Hope everyone had a very Merry Christmas, and do take the time to give God thanks for being in a position to take part in the commercialization of the holiday in the first place.
If you're interested in the abridged version, here is a quick history of Christmas from the Christian standpoint. There are others (pagan rituals) that occur at the same time and sometimes get confused as "Christmas".
http://www2.worldbook.com/features/holidays/html/history.htm

And yes, it will do SSB and cover all subspace frequencies.
:-)

I can e-mail to anyone interested photographs supporting my claim.

* letter of induction to the FBI, showing the job title of Radio Operator,
signed by J. Edgar Hoover.
* letter of assignment to the Newark NJ field office in 1957 signed by
Hoover.
* picture of the retired FBI credentials dated from 1957 to 1994, which
shows the job title of Communications Specialist.

Other than that, there's no documentation. What do you expect? No one knew
at the time of historical significance of the key.

5163. Re: Shakira getting dirty with dildo

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-26 13:12:11 UTC
From: Mark Russo <rmrusso1@optonline.net>
Message-ID: <3FEC3477.768DB44@optonline.net>
Source record: 24686
Cross-posted to: rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

does it cover the 2 meter and 440 band and does it use the SO-238
connector?

<< I realise that Bob. My comments werent pointed to you at all. Just kind of irks me at others that would rather criticize than lend a hand. >>

Bob & Brian-

I responded to the original poster in another group (homebrew), and included a copy to his E-Mail address. He replied with more questions which I tried to answer, but I haven't seen any follow-ups to his postings. He may have never returned to the newsgroups to see if there were any posted responses.

In my opinion, he was "fishing" for someone to repair some old tube-type stereo equipment. Perhaps the audio/hi-fi newsgroups would have been best for that as well.

I need a couple of small pieces (1-1/2" X 2-3/4") of transparent plastic tinted preferably red but other colors may be acceptable.

These are for a display window on an electronic readout.

If anyone has a small sheet of plastic stock like that or can suggest a retail outlet that may offer it, I would appreciate it.

Is it the same for all modes (USB-LSB-CW)? My guess is that it is not. Most transceivers of this vintage Mix Hetrodyne (band) VFO and carrier frequencys to arrive at the Transmit or receive freq. The Hetrodyne and VFO frequencys are the same on xmit and receive. The carrier (mode) crystals are changed to allow for offset for USB-LSB-CW. My guess is that one of the crystals has shifted. Use a frequency counter to locate which one and then you will probably be able to net it via the small calibrating capacitor in the circuit.

Hi Andy, I recently purchased some "polarizing film" for the same purpose,
and the minimum purchase was 2 feet square. If you'll confirm your address,
I'll drop a piece in the mail, 4 square feet is a lifetime supply for me.

Jingle bells

It'll work, but its impedance may or may not match your Yaesu. You may
have to make a few mods to the mike. See the info at this guy's page:

Close enough to absolute. The Supreme Court has not upheld a
conviction based on "fighting words" since 1942. You lose.

An outcome determined by lawbreakers in no way makes the
behavior legal. I hardly think your most honoorable relative would
condone such behavior by the residents of Compton or, more
pertinently, by you, even in defense of his own probity.

Go to a place that sells plexiglass, and buy a small piece of thin
red plexiglass. I think another color, like smoke/gray may also
work. You may find they already have a box of scrap pieces, that
they'll sell to you real cheap, or maybe even free. Since you
need only a small piece, you have more luxury than someone who needs
a big piece.

Or, assuming you just want it for contrast and dust rather than
because you expect a lot of pressure or force on it, you can go
to a stationary store and buy a red plastic report cover. Cut out
the pieces you need, and mount it behind your front panel. The cover
should cost under a dollar. Again, you might also consider smoke/gray
covers.

For red stuff, you could also try an auto parts store. Look
for the material used to temporarily repair broken taillight lenses.
You can also layer it ig you need greater density.

thanks for the suggestions Michael.

Harold, W4ZCB is sending me some material he used on a similar project.
There will be no pressure or stress on it. It is merely cover for a
digital readout more for aesthetics than anything else.

I had considered Lexan and using some sort of film on it, but Lexan
off-gasses, and would most likely bubble up any type of applied film.

I see that you are an uneducated dolt who cannot tell the
difference between "freedom" and "license". I suggest you
investigate that difference. When you report your results to us,
don't forget to mention Tom Paine and also Sra. Montisorri.

Also please stay off the air until you have learned the difference.

The original owner, if he is still alive, can provide an affidavit.
If he is not alive, others who have direct knowledge of the
situation could provide such an affidavit. The provenence of
historical items is often handled this way. I would not buy
it without such an affidavit ...

Sure has been fun watching folks jump to amusing conclusions.

5192. 2 meter for Off road race car?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-27 02:43:26 UTC
From: highonthai@sbcglobal.net
Message-ID: <f52dc8e3.0312261843.13a354e@posting.google.com>
Source record: 24615

I'm looking to buy a new 2 meter radio for my Off road race car.
I currently have a road master which has seen better days...
I need something that is *very* durable. I don't need all the bells
and whistles.
Mainly use it on one or two channels. there are a couple of "race
Radio" shops around but they want a little too much, for what I think
I should be able to buy at a HAM shop.
I have been looking at the Yaesu FT 2800M and the Kenwood TM-271A both
of which are Mil/Spec rated.
Is their anything I can do internaly to make them more shock proof?
Any opinions on what might be my best buy?

Thanks,

Scott

rhockenberry@verizon.net says...
> Anyone have any experiece with the Elecraft K2 and K1?

I've only heard good comments about these rigs, which is pretty significant in itself. (Remember, though, that these are KITS rather than ready out of the box systems.)

There are also some groups on Yahoo! Groups which specialize in QRP discussions, also some specific to the Elecraft product line. You might want to visit http://groups.yahoo.com and search for "qrp" and for "elecraft" to find them. In the Elecraft-specific groups, you'll also find photos plus information files about mods, hints and kinks, etc. specific to these rigs.

Elecraft also just came out with a new CW rig, about the size of a paperback novel with the paddles built in. Worth checking their web site about it.

mmm, interesting - do you mean 200 cycles rather than 200 kilocycles?
- and have you verified this by measurement or are relying on signal
reports "on air" - depends on who is giving the report, is their radio
set up properly?

Look in the service manual for carrier osc adjustment - chances are
one of the previous owners has "fiddled" with the trimmers. BTW, the
RIT on the other persons receiver is designed to overcome minor
frequency differences....

5205. Wheel-mouse tuning?

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-27 15:29:18 UTC
From: Dave Strasz <wt3h@ptd.net>
Message-ID: <2jidnVc38uK8OHCiUSdV9g@ptd.net>
Source record: 24628

Is there a mod or add-on that would permit the tuning of the Kachina 505 DSP transceiver with a 'wheel-mouse'?

Some wheel mouse features permit programming mouse-button functions - however I haven't seen any way to set up a wheel-mouse to emulate the up/down arrow functions.

Thanks. wt3h@ptd.net

5206. Elecraft K2

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-27 17:25:18 UTC
From: davearea51@aol.com
Message-ID: <20031227122518.19161.00001418@mb-m13.aol.com>
Source record: 24629

With the review of the latest and greatest from TenTec in the most recent QST, I couldn't resist pulling the review of the K2, also from an (older) QST, from the file cabinet and comparing the K2 measured performance specifications against those of the latest TenTec radio, the Orion. In virtually all cases, the receiver parameters reported by ARRL for the K2 are at least as good as the respective parameters of the Orion transeciver, and in some, even better. I could find only one case where the Orion outmeasured the K2 receiver. The blocking dynamic range of the Orion at 5 kHz with the preamp on is a little better than the K2 by 5 or so dB. That's it ! !

I own a K2/100 and I must confess it has none of the digital birdies of the TenTec Omni VI (10-meters, especially, is particularly bad) which I also own . In addition, the K2 handles readability of a signal, be it SSB or CW, noticably better than the Omni VI during noisey band conditions. Oh, and I especially like the fully settable Jones crystal filter which is standard in the K2. The designers at Elecraft did one excellent job of design! Even for the money, I doubt if you could find a significantly better transceiver on the amateur market today. Spend $1k for the K2 and you won't get much more performance that counts by spending $5k.

Dave - W0LEV

PS: No, I'm not associated in any way with Elecraft. However, I have high respect for the designers at Elecraft.

Your position was a legal one?
You are a lawyer?

> >Also please stay off the air until you have learned the difference.
>
> At your behest??? And who made you the arbiter of who is
> allowed to speak? The guy who puts people in the hospital for
> impugning the family honor? Nice try.

I have the same "right" to speak my mind as you do.

Clearly you must be a lawyer, or at least pretend to be, otherwise
you would not have put that "allowed" in there. I didn't say anything
about what you are "allowed" to do or not.

When you fix that education problem,
add a course in reading comprehension.

Focus on "freedom" vs. "license" and "demand" vs. "request".

HNY!

I recently picked up a '1000D and am interested in its age. I know this rig was manufactured for about a decade. The S/N is "2E220171". Anyone with a '1000D that might have some insight?

Thanks.

I don't have to be a lawyer to understand (or state) that
battery in defense of a third party's honor in retaliation for
first-amendment-protected speech is illegal. It makes you a felon.

>
>> >Also please stay off the air until you have learned the difference.

Clearly you're attempting to put words in my mouth.
Meaningless ones at that.

>
>Focus on "freedom" vs. "license" and "demand" vs. "request".

Focus on anything you like -- I don't need either your
permission to speak or your childish attempt at directing my
education. All you are accomplishing is reinforcing the impression
that you find a felony to be acceptable behavior when faced with a
perceived slight.

They are probably good kits for a yongster, to get them interested in
radio, or find out how interested they are. But I won't buy any more
of them for serious use.

Possibly a bad pass transistor. Try pulling each pass transistor out
one at a time (or pull them all out and put them back one at a time
until you blow a fuse) or if you have a transistor checker, check them.
Another possibility, is you are getting an over voltage and the
crow-bar circuit is activated. This could be caused by a problem in the
regulator circuit. Possibly a bad LM723 regulator IC. These chips are
pretty inexpensive and readily available.

It's a lot 22 built in 1992. Give you a perspective I bought a new 1000
in Jan of 93 and it was SN 2E220166, I still have the original invoice.

Then in Jan of 2000 I bought yet another new FT1000 the SN of that was
8K55xxxx, so that one was built in 1998 and it was a lot 55 one of the
last FT1000's and a good radio, improved over my first. I still have
the original invoice from TT.

Just got my General ticket and want to mount my htx-10 in the car. I have a Saturn coupe and want to mount a 10m hamstick on the trunk and also want to install an amp. This needs to be a cheap evolution and am unsure about amplifiers and the installation. I only need to push 100 watts I guess. The htx is 25 watts ssb. Will I need an extra battery if I run an amp? Or do I need an amp at all?

Thank you

Forget the manufactured for amateur radio junk and find yourself a surplus Motorola radio.....model and frequencies of course will depend on the basic RF performance you require. Of course everyone will have their own testimonials but I've personally seen, for example, HT1000 portables (in their leather holster) accidently dropped 20 feet onto steel decks and a Radius portable that was left on the hood of a truck and flew off at over 40 mph bouncing off the pavement - both of which were picked up and were in GOOD working condition (first was unscathed, second one needed a knob and the case was cracked).

Source record: 24553

I would first check the diodes between the transformer and filter cap.

To prevent causing more problems do service checking with a 100 watt light bulb
in series with the AC line. This bulb normaly should glow bright for a second
when power is applied (Chargine filter caps.) then fade to dim if all is ok.
(no load)
If it continues to be bright with no load on supply you still have problem.
This limits current thru transformer. Saves fuses and transformers or circuit
boards.

good luck,
Don

I
> need an amp at all?

Going from 25 to 100 watts will not be that much of a gain. Only about 6 db. That is what some think of as one S unit. Try it without the amp first and see how well you do compaired to others. Instead of an amp you may want to just look for a used 100 watt all band rig. The battery in the car is fine. YOU do not need anotehr battery as long as the car is running. With the car off much transmitting and you will need a seperate battery to get you started again. On receive you can leave it on for several hours without any problems.

5233. Yaesu MH-36D8 DTMF Microphone Question

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-28 16:18:22 UTC
From: Pat Magroin <rcole002@twcny.rr.com>
Message-ID: <a80uuvkusugsbvr2lt7jg8mg9fr8359j9m@4ax.com>
Source record: 24556

Greetings...just picked up the MH-36D8 hand microphone for use on my FT847. There are two buttons on the mic, labeled A and B. The little paper that came with the mic states that these buttons are used to "Activate an accessory function" When I push either of them they both change the tuning rate on the FT-847 to FAST. I "think" that I should be able to assign a function to either of these keys, but can't find any mention of it in the FT-847 manual or on the little scrap of paper that came with the mic...Any ideas? Thanks....

5234. Re: htx-10 mobile installation

Source record: 24557

<< Just got my General ticket and want to mount my htx-10 in the car. >>

Greg-

1. As Ralph said, try it barefoot and see how it goes. Generally, if you hear a station well, they will hear you well unless they're running a LOT more power.

Rather than waste money on a CB amplifier, you should consider upgrading to an all-band rig such as a Kenwood TS-430, 450, 570, et cetera. Then there are the nifty little radios like the Icom 706 or Kenwood TS-50, that are barely larger than the HTX-10.

2. The Hamstick is a good choice. It would be easy to change to a Hamstick for another band if you were to upgrade the rig. It compares to the Hustler mast plus resonator I use. However, it may be a bit heavy if you use the trunk-lip mount. In that case, there are lighter antennas available that work almost as well. If you have any old CB antennas that would fit the mounting location, you should be able to cut them down. Be careful you don't cut too much!

3. No, you should not need a second battery. Suppose you ran a 100 watt rig on Ten FM, that would draw about 20 Amperes. Divide the amp-hour rating of your battery by 20 to see about how many hours you could hold the key down before a fully charged battery would be depleted. Normally you don't operate in a continuous key-down mode, and SSB draws less average current still.

If you are worried, be sure you get the largest battery that will fit the battery compartment in your car, the next time you replace it. A larger battery usually means more amp-hours. (My Toyota came with a smaller battery than it would hold.)

4. When you get on the air, ask about the Ten-Ten club. Also try checking in to the Titusville, FL, ARC Mosquito Net on 28.333 MHz, Wednesdays at 7 PM Eastern Time.

73, Fred, K4DII

PS: Is that your picture at www.qrz.com? You may have passed the General test but the FCC data base doesn't reflect it yet.

You can fake CW by feeding an audio tone into the mic input. You just have
to be sure the tone is pure and not overdriving the rig. Use about 900 to
1000 hz.

As an FYI, when they say "UP TO 5 miles", here in the real world,
think "UP TO TWO miles if everything goes right".

Also, stick with brands you have heard of, less like to create
headaches. Pricing on identical items can vary greatly, so shop
around.

Greetings,

I wonder if anyone could help me out with this one...

I have a FT-757 and recently bought it's matching FC-757AT antenna tuner.
The only problem is that it came without the matching interconnecting cable
(referred to as Connection Cable C T9101292 in my manual).

Does anyone have this cable that I may buy? I could certainly fabricate one
but the connectors seem Yaesu proprietary. If you have any information,
hints or guidance I would certainly appreciate it!

Many Thanks and 73,
Vaughn

Yes, but the one GMRS license covers literally everyone in your
family. Aunts, uncles, cousins, in-laws, you name it, they are
covered. Gets pretty cheap if 10 people get radios.

I agree with the comments regarding power and range. If you want any
kind of decent performance, don't get one of the bubble pack radios
like you see at Wal-Mart. Get a real radio, and make sure it has a
removable antenna. If you buy a combo FRS/GMRS it won't have one as
it's not legal on FRS. It's good to be able to use a mag-mount, etc
for increased range. I have two (real), 5-watt GMRS radios, and two
25-watt mobiles. With a decent antenna you can cover a pretty good
area. If you want to use (or put up) a repeater, be sure the radio
can transmit and receive on the GMRS repeater frequencies.

At least one license will cover all members of a household, which
helps the OP.

Not all that useful for a group of individuals who live alone, unless
each one gets a license.

Hypothetically, I would guess that some of these radios are used
without licenses.

Source record: 24575

I'm considering putting up a good antenna, to go with my new BC796D scanner. It seems many of the scanner antennas on the market are made very poorly, and don't hold up over time, and weather. Has anyone spent the big bucks for a Create Log-Periodic 5130-2N? It's a wideband, high~gain, directional antenna that offers 11~13 dBi gain from 105~1300 MHz. But at $300.00, I'm hesitating.

There's not a whole lot that can shake loose in those radios,
especially if they're mil-spec rated -- and there are certain ratings
for shock-proofedness you can look for. Otherwise, you might call Fair
Radio, as well as Surplus Sales of Nebraska, to see if they have any
military-type shock mounts for radios (they both have web sites where
you can get contact into).

I believe some of the Yaesu radios are also sold in commercial
versions, and have tougher than usual construction.

OK. Here's the fine print.

95.1 The General Mobile Radio Service (GMRS).

(a) The GMRS is a land mobile radio service available to persons for short-distance two-way communications to facilitate the activities of licensees and their immediate family members. Each licensee manages a system consisting of one or more stations.

-- and --

95.179 Individuals who may be station operators.

(a) An individual GMRS system licensee may permit immediate family members to be station operators in his or her GMRS system. Immediate family members are the:

(1) Licensee;

(2) Licensee's spouse;

(3) Licensee's children, grandchildren, stepchildren;

(4) Licensee's parents, grandparents, stepparents;

(5) Licensee's brothers, sisters;

(6) Licensee's aunts, uncles, nieces, nephews; and

(7) Licensee's in-laws.

Note that the regulations only identify immediate family members. It says nothing about them being in the same household. It would probably be stretching it some if everyone wasn't in the same town, or within a few miles of each other, but the regulations do not specifically address this. They only address being on the same "system."

Hi,

I just downloaded a peice of software called Softscanner, from
http://www.softscanner.net

It claims to be a Scanner only you dont need the hardware. It also has
ACARS/NAVEX decoder built in.

I have listened to many pilots and towers and police, fire and 911
channels live. My question is: is this real or phony, as I have no
radio hardware attached to my PC.

I am waiting for a breaking news story to come on tv, so I can tune
Softscanner to relevant police or fire channel and see whats going on.
That way I will be able to tell if it really is live transmissions I
am getting on my PC.

I am sorry if I sound a bit dense, but I am new to this kind of thing.

Regards,

Danny

Thanks for looking that up. A bit more generous than I thought.

Still doesn't work for a non-profit organization situation, where the
connections are not through blood and marriage.

Happy trails,
Gary (net.yogi.bear)

I selling some old toys so I can get new one's.

Kenwood TL-922A Amp.
Will do 160-10 meters but 10 meter option not installed, 1.5KW, (2) 3-500Z
Very nice condition with a few scatches, will send pictures on request.
$950.00 O.B.O plus shipping.

ICOM IC-2720H
2 Meter / 440 Mhz daul band mobile, lots of features and in new condition.
Radio is 6 months old. $275.00 O.B.O plus shipping.

Yeasu FT90R
The radio is in new condition but I lost the manual and mobile bracket.
Should be able to download the manual from Yeasu's site. $175.00 O.B.O plus
shipping.

Will send pictures on request.
Please contact me at.

Hello,

Just saving this from the dump. It's a Gonset GSB-100
chassis - missing most of the 'good stuff' - no VFO, no
face, no knobs, no tubes, and no power transformer.
JUST the chassis with all the IF cans, tank coils,
interstage xfmrs, sockets, and all the parts on the under
side of the chassis. No tank capacitors and absolutely
NO cosmetic parts or xtals at all. Also has the bottom cover
only - it's a molded part of the case, but no top part. Again,
NONE of the 'good stuff' is left - drum, dial, xfmr, xtals, etc.
Most of that all went into restoring my own GSB-100. But
still some good stuff here that doesn't deserve the dump.

FREE for pickup in Tacoma, WA or you pay a packing
charge and shipping charge. I really don't consider this
worth the $20 - $30 it would cost to ship, so please consider
that before saying you want it.

Email if you're local and I'll work out the pickup. I'm off to
the dump right now - this chassis got a reprieve, but it
won't last long - it goes to the dump a week from today
if still here.

Thanks,

Dave WB7AWK

5264. Re: Yahoo Group for Radio Shack DX-394 Users

As co-ListOwner/co-Moderator of the RADIOSHACKDX394 and DX-394C Yahoo groups, I think I have a small obligation and privilege as 2003 draws to a close to look back over the past year in the life of our subject, the remarkable Radio Shack/Realistic DX-394 communications receiver plus the activity in our groups and share some observations with you. This has indeed been a remarkable year for both - the number of messages and growth in membership perhaps being the easiest indicators.

Over the nearly three years since jimtown54 founded RADIOSHACKDX394 it has grown to some 550 members, one of the largest product-specific communications receiver groups in Yahoo, second perhaps only to the DX398 group. The message archive has mushroomed from a mere 88 messages added in 2001, an explosion of 546 more in 2002, to an amazing 1450 new messages in 2003. This signifies a growing knowledge of our DX-394 community and keen interest in the possibilities for improving this economical, feature-rich radio. Most members are from the US and Canada, there's a significant number from the UK and small numbers from almost every continent.

Early this year, I was prompted to consolidate all the known modifications into a master list or index so that people would not have to search in the thousands of messages and scattered pages on the Internet to discover the proverbial needle. Through the year, this index has grown to include 62 mods - by far, more than for any other radio. For those willing to experiment with and learn a little radio-electronics, there can be few more intriguing and rewarding platforms than the DX-394 as it combines both digital control and conventional analog RF electronics in a box that is larger and more spacious than most radios in its price range. It is relatively easy to work on, if you have good eyes and a steady hand!

Interest in the digital control possibilities led to the formation of the DX-394C group last winter - now numbering 91 members and 89 messages. Few have undertaken the challenge of converting the DX-394 to computer control but the Files section is a rich trove of information to help the daring ones embark. The group has been quiet since April - I hope to see more activity through the long winter nights and to resume my own PIC-based project (or re-launch it on another platform).

Later in the year, John (KB9KQN) launched the DX394L group for those disinterested in modifications and wanting a community of fellow DX-394 users with whom they could exchange general listening tips and interesting frequencies.

John and Howard (derny_99) agreed to take on co-Moderator responsibilities for RADIOSHACKDX394 - new membership requests are now processed by one of us

within hours of the application. Spam and off-topic postings have been pretty well controlled. Recently, we escalated the security and now require Moderator approval for initial postings from new members.

Trade in the DX-394 on eBay continues at a steady pace since I started tracking sales from Oct 24. Fifty DX-394's have been sold since then, an average of over 5 per week. Average selling price was US$159 out of a range from $105.50 to $265. The higher prices being commanded for well-modified radios.

So 2003 has been a banner year for the DX-394. Let's hope it continues in 2004. I wish you good health and prosperity in the coming year along with great listening and learning with your DX-394(s).

73, Tom VE3MEO

The 706 can only sink so much current. Could be the internal
linear relay isn't working as it should?
Just a thought. Maybe you need an external relay (ss or mechanical)
to do the trick. I use a tiny relay removed from an old
modem board.

Cheers

Source record: 24597

I have a Kenwood TS850 that seems to be experiencing more technical issues than usual. Currently, it is down in Southern Oregon where I used it during high school. However, I am having two issues:
1. When using the automatic antenna tuner, it will not tune up. It tries to tune, but gives me a series of beeps after about 20 seconds. Those beeps indicate that the tuner can't tune to the right SWR. This problem only occurs on 20 meters and no other bands.
2. I am not picking up very good signals. No matter which band I try, I can't pick up anything except for a few weak signals and I can't understand what anyone is saying. Are all the issues described related to my antenna? Could it have something to do with the band conditions? My antenna is a g5rv, which has worked really well before. Thanks in advance for any recommendations.

Message-ID: <bsrcaofgk1@news5.jaring.my>
Source record: 24499

Anybody can help me on this type of modification cause I already reffer to one of web site for modification and the site really show how to do it. but unfortunately when I open my rig, the position of resistor not same as the picture showed.

The site say there is two resistor next to the cpu, and I need to remove the most front resistor (only one)[CPU pin No. 62]

But when I open up my rig it happen that only one resistor which sit on CPU Pin No. 60. Do this set already open the tx frequency ie; 134 - 170Mhz.

Any idea if I removed this resistor, what will happen? This resistor got no value written (SMD), If I remove and damage this tiny resistor I might not able to get the substitued for it. That is why I'm a little worry for this modification.

Any kind help much appreciated

Thank you

I happened to be in Costco today and looked at a Motorola set
which referred to a large number of FRS + GMRS frequencies being
available. Based on an earlier posting, I spent a few minutes reading
everything visible on both sides of the packaging. As suggested in
that posting, the word "license" appeared nowhere in the text. They
sure don't seem to feel any need to help the buyer stay legal.

You have an antenna problem, if you aren't hearing much, and the radio
is ok (stick a hunk of wire in the coax connector, and see what you
get), I would bet the coax has water in it, or something else is going
on. The tuner will tune up on about anything, as long as RF isn't
getting into it, and making it unable to tune. I had a tuner that tuned
everything, except my back up dipole in the attic. When you say you
can't understand anyone, is it because they are so weak? Or is it
because they are garbled??

The actual SWR on my dipole was only about 2:1, but RF getting into the
radio (The antenna was about 6 feet above it seemed to confuse it), and
making the tuner crank and crank and crank, and then give up. Tuning it
manually was nothing but a minor turn of both controls.

Good luck.

BDK

It's in the manual when you open it up.. but yes, they should be mentioning
licensing on the outer packaging. They do tell you not to use it on GMRS
channels without a license (these radios use FRS power levels on FRS
frequencies).

Howdy Eric.....what you need is a divide-and-conquer strategy there. BDK suggests that it probably is your antenna and to stick a piece of wire into the antenna connector to see what you get.....good idea BUT DON'T TRANSMIT (or auto-tune) with this! My suggestions are these: Connect your rig into your dummy load (essential piece of equip for ANY ham!) and see if it will now auto-tune quickly and show full power out. Next, as BDK suggests, try plugging in a random wire (can be anything....test leads etc) to check basic receive operation - are there significant signals now? I also noted you mentioning that you couldn't read them.....are they distorted? What sort of signals were you listening to - voice - morse - data? If you've got this far and things seem ok, try another antenna OR another transmitter to see if it will load into your antenna. I suspect that somewhere in these first few steps you'll see where you have to make repairs.

Yes, I've seen those as well. As a licensed ham operator, I tend to be
sensitive to being properly licensed to transmit.

If they mentioned this, it would no doubt hurt sales. And they can
always fall back on "it is the purchaser's responsiblility to be
licensed". Considering where most of these are sold, depending on the
salesperson to know this is not a good bet.

Of course, a GMRS license only tests your ability to write a check and
mail it to the correct address.

That's strange. The 102-ft. g5rv antenna is actually resonant on the
low end of 20 meters -- it's a random length dipole on all other
bands. Have you checked the swr on 20 without engaging your tuner? You
shouldn't need to tune it at all.

Otherwise, I'd check the coax, the coax connectors, the balun (if any)
beween the coax and the twinlead hanging off the antenna. And, as
another gentleman suggested, just attach any old random wire to your
transceiver to see if it's hot with received signals. If not, I'd
guess something's wrong with the 850.

Source record: 24508

"Charles J. Shaw" <cshaw@epix.net> wrote in message:
> My Kenwood 940 is failing to find a "match" when I engage the auto
> tuner.

Charlie,

The first thing to remember is that the 940's tuner, like most built-in tuners has a fairly limited range. I have been able to tune a tri-bander on 160, but that does not mean that the tuner was designed to do it.

What I did, whenever the built in tuner would not match, was this:

1. Meter switch to SWR.

2. AUTO/THRU to AUTO position.

3. Press AT.T.

4. Observe SWR readings on meter. You will note that the meter readings go up and down as the tuner attempts a match. when SWR hits an acceptable level, i.e., between 2:1 and 1.5:1, disengage tuner by pressing AUTO/THRU button.

5. After tuner stops, re-engage tuner using the AUTO/THRU button, go to rtty/am/fm. Set power to lowest level. Transmit and check SWR.

6. If the SWR is still OK, then operate. If not try the cycle again.

The software in the 940 is trying to get to the 1:1 SWR level. This is simply not always possible given the limited matching capability ofthis tuner and the unlimited types of loads that could be presented at the antenna. 1.5:1 or even 2:1 is acceptable to the finals, but not to the AT software routine.

Then there is the real possibility that you might have a problem in the tuner/radio combination. If you observe the meter while the tuner is in operation and see no variance in readings, or hear no activity of the tuner, then there might be a problem.

Try giving the auto-tuner a little external assistance.

Connect a few micro-henrys or a capacitor in series or in parallel with the transmission line at the antenna end of the tuner. This will often shift the line input impedance into a range which the auto-tuner can accommodate.

Or try changing the length of the line by a few feet.

If the line input impedance is measured it can be deduced what sort of additional component is needed for one awkward band. It may not adversely affect other bands.

In the worst case situation you can always prune the antenna. Never give up.

It is an efficient way to do the transmission, I understand - maybe the most efficient?

It also needs just 3 wires. 90 degrees would need 4 wires or 3 wires with 1 wire that is thicker than the other two.

It better uses transformer iron and makes better/cheaper induction motors. For making DC it requires less in the way of filtering. It would be nice if we had something like 6 phase power, we could get rid of the input filter caps in most equipment, the only part that we can't make smaller by increasing efficiency and frequency of SM power supplies.

Best regards,
Spehro Pefhany

The motor is effectively running on a much higher voltage than single phase,
so more power/weight, and to change direction just swap any 2 wires over.

Because the power lost in the transmission line resistance is proportional
to the square of the current, you want the current as small as possible.

Ways to do that are to increase the voltage and to increase the number
of phases.

While there is no theoretical limit to the number of phases you can have,
3 is the generally accepted trade off between efficiency and complexity.

And in most places, "plain ole hot & neutral" comes in as 2 phase, also
called "220".

Actually, this is normally called "split phase" rather than 2 phase because
the the neutral 'splits' the single phase 240 volt drop.

Actually, what it's called is dependant on where and who you are.

Engineers and electricians, for example, have different terms for the same
things.

Only thing is, after assembling the kit then finding out it dosen't work
as described, they may be discouraged.

The question of whether 120-0-120 is split-phase or two phase is not
just a fighting issue in the US, it's a TOTAL ANNIHILATION issue. (;-)

Wholly incredible to this poor Brit.

In England a 230 V single phase is just that, one wire is nutral, nominaly
earth but seperate from the true earth, and the other caries 230V ac.

I belive the American system is 2 x 110 V ac lines with respect to earth,
but at 180 degree phase angle, to give 220 V ac potential between them.

I would say it's fair to call this 2 phase.

Yes (or is it now 240 nominal there)?

>I belive the American system is 2 x 110 V ac lines with respect to earth,
>but at 180 degree phase angle, to give 220 V ac potential between them.

120V, but close enough.

>I would say it's fair to call this 2 phase.

Not fair, just WRONG, though I can see that electricians who think of
"phase" as equivalent to "hot wire" might find it okay. True two phase
could be converted to 3, 6 or whatever phase using Scott-T
transformers. Not true for this, which is just a center-tapped 240V
line. You can go right or left on a one-dimensional line from zero,
but it's still in one dimension..

Yes, and even while being extremely careful, I swapped
phases 127 and 131, 177 and 178, 202 and 212, 214 and 215,
and 301 and 311.

I think a need phase tester too ;)

With 3 phases you never run out of juice, even without a cap,
so why do you want 6 ?

In many large solid-state rectifiers, (> 100kw) phase shifting transformers are used to generate 12, 18, 24 or even 30 pulses of current per cycle. Aside from simplifying the filtering, it simplifies the harmonic current problem on the supply line.

But, no matter how hard you try, you can't do this with a single phase source, 2 or 3 or 10 wire. If a transformer has a single primary winding, it delivers single phase energy, no matter how the secondary is tapped.

Not sure that anybody mentioned that a single phase motor has a 4x/cycle torque zero (2 voltage zeroes & 2 current zeroes). 3 phase eliminates these zeroes.

I would hate to have you navigate for me if you don't see a diference
between left and right...

I would sugest you would learn the difference between a single and two phase
system in a hurry in Russia, they earth the nutral leg to the frame on all
machines and then have a seperate earth bond. (don't try to use an RCD
:-)).

I found an Instructograph Morse code trainer (with a paper tape!) in an antique store in Austin, TX, if anyone is interested (I can't justify it myself). They want $150 for it. It appears to be in good shape, although I didn't try to run it. Email me if you are interested in seeing pictures.

The store is on Red River Drive (?) and is owned by a fellow named Attal, but email loriscott@austin.rr.com if you want to buy it.

In special-purpose applications, usually motor drives, more than three
phases are sometimes used.

For "regular" industrial motor drive, three phase is very nice because
it ensures that the motor runs in the right direction. That is, until
the electrician's rewire things so that they run backwards!

Tim.

Less ripple. You want to work out the difference?

If I did the calculations right, the ripple is from peak down to 50%
off of peak for 3-phase vs. only 3% down from peak for 6-phase.

The SMPS would have to work a lot harder to handle that range,
especially if you want the same supply to handle 50% * 85% * 100V for
"universal" input (Japan residential).

Best regards,
Spehro Pefhany

And 3 phase motors don't need those troublesome starter caps/windings..

I've worked with 3ø 480 volt systems (for industrial clothes dryers).. until
I worked on those, I had never seen such strange things as a short in a
terminal block vaporizing wiring DOWNSTREAM from the short... : |

That's a good point, the universal input. Is an inductor a better
storage for energy than a capacitor, I wonder, from a dimensions
point of view...

sci.electronics.basics,

alanh_27@yahoo.com (Alan Horowitz) asked:

>what is the attraction of three-phase power? Why not 9 0r 317
>phases? Why not plain ole hot & neutral?

Three-phase offers constant power transfer from instant to instant,
whereas in a single phase (into a resistive load) the power varies as
a 1+cosine (or sin squared) function, going from zero to a peak twice
per cycle. Constant power is essential for large generators and motors
so that they will have low vibration.
Look in any textbook with a name like "AC Circuits Analysis" for
more info and full mathmatical derivations.

Alan,

It has to do with efficiency, cost, complexity, etc. It was not a casual decision. If one uses a delta configuration, instead of a Y, then you only need three leads, not four.

Evan

Actually, you can get 6 and even 12 phases out of 3 phases fairly easily.
If you put a normal single primary to center tapped secondary (120/240 in
North America) on each of the three phases (tie all the neutrals together),
you really have 6 phases.

```
Y3 * * X2 X0 is in the center, and legs are X1, Y3, X2, Y1, X3, Y2
\ / X[123] to X0 gets 120 volts
\ / Y[123] to X0 gets 120 volts
X1 *----*----* Y1 Xn to Yn gets 240 volts
/ \ X1 to X2, or X2 to X3, or X3 to X1 gets 208 volts
/ \ Y1 to Y2, or Y2 to Y3, or Y3 to Y1 gets 208 volts
Y2 * * X3
```

I've never seen a 3 phase transformer with this configuration, probably
because there is virtually no need for it. If you really do want it,
you'd have to build it from 3 separate 1 phase transformers.

If you were building a large computer machine room with lots of switching
power supplies, and your power feed is three phase, this might actually be
useful to minimize the 180 Hz component on the neutral. If you used a
standard 208Y/120 feed and ran computers on everything, you could see as
much as 2-3 (depending on how wide your current pulse is) times the current
on the neutral because of the timing offsets of the switching power supply
currents. 1 phase power doesn't have this problem as long as the computers
have similar current waveforms (they cancel out on each side). With the
above 6 phase configuration, you'd get the advantage of 1 phase balancing
while keeping the load balanced on your 3 phase feed.

But the payoff might not be there since the above requires 7 wires, whereas
you can compensate for high neutral currents with larger neutral wires and

stick with 4 wires (one fat, or doubled or tripled). Also, you can get UPSes that use 3 phase power, and that should take care of the problem. You'd want to use UPSes, right?

Motors and transformer power supplies can work on 3 phase power as if they were 6 or 12 phase. Normal power feeds have a wye secondary, so you get either 208Y/120 or 480Y/277 or 600Y/346 depending on your service category (the latter 2 use an additional transformer to get the 120v level). These wires are labeled X0 for neutral, X1, X2, and X3 for the three hot legs.

Lets say you have a very high power motor that uses 480Y/277 (typical for high power industrial motors) and does this with 12 windings. 6 of them would be designed for 480 volts, and the other 6 for 277 volts. Then the connections would be, in order:

12 o'clock X0-X1 277 volts, 0 degrees
1 o'clock X3-X1 480 volts, 30 degrees
2 o'clock X3-X0 277 volts, 60 degrees
3 o'clock X3-X2 480 volts, 90 degrees
4 o'clock X0-X2 277 volts, 120 degrees
5 o'clock X1-X2 480 volts, 150 degrees
6 o'clock X1-X0 277 volts, 180 degrees
7 o'clock X1-X3 480 volts, 210 degrees
8 o'clock X0-X3 277 volts, 240 degrees
9 o'clock X2-X3 480 volts, 270 degrees
10 o'clock X2-X0 277 volts, 300 degrees
11 o'clock X2-X1 480 volts, 330 degrees

An AC/DC power supply could use 6 transformers wired for each of the 6 phases (but not the opposites), and feed full wave bridges to get nearly DC with a very low 720 Hz ripple (the secondaries would have the 12 phases above). For very large power supplies this can become practical since you don't need as much of a capacitor bank to smooth it out (or you can get a much smoother DC if that's your goal). 3 of the transformers would have one voltage for the primary and the other 3 would have a different voltage (208 and 120 for the most common three phase power in the US).

If you didn't want to go to that extreme, you could still do a 3 transformer version that gets you a 360 Hz ripple. These would all have the same primary voltage, and could be attached either between legs and neutral, or between each hot leg, depending on voltage, or even work on a delta feed.

With more transformers strategically wired, you can get 24 phase, 96 phase, and so on. At some point you might not need any filter caps :-)

Unless you are tapping for 120 on a 240 Delta or 240 on a 480 Delta, in
which case a center tap of any of the phases becomes Neutral for a split
phase Edison circuit.

I understand what you're saying, but everything was working fine,
for several years, and now it's not. The rig, the feed line, and the
antenna - a 10 meter dipole - have not changed in obvious physical
condition.
The last time that this happened, I took the rig into a repair shop.
I was told that it, "was just some carbon build-up on the relay." I
don't know if this was the cause, but the bill didn't add up to much, so
I assumed that this was the case. I felt a little stupid for not
considering something this obvious (always check the simple things
first, right?), but I just packed it away as one of life's little lessons.
I checked the relay on the tuner and sprayed it with some contact
cleaner, but the problem still exists. I "should" be able to fix this. I
think that I'm just overlooking something...but what?
I thank you for your response.

I have an original KAM running Ver6.0 and I'm looking for whatever rev was the latest for that particular hardware before additional daughter boards were needed.

I have a burner so I really only need an image file.

If anyone has a higher release, or if there are NO newer releases, I would appreciate the info.

Thanks, and happy new year!

5331. ICOM IC-W32A Cloning Problems

Newsgroup: rec.radio.amateur.equipment
Date: 2003-12-31 02:44:57 UTC
From: "John M. Orange" <JOHN-1@W3ZDF.ORG>
Message-ID: <kvc4vvchji4hgk3gpdulajth3j0dm620r7@4ax.com>
Source record: 24454

I just bought the cloning cable and the CS-W32 cloning software for my new IC-W32A. After writing in 35 vhf repeaters into an .icf file, I connected the radio to my serial port and tried to upload the file to the radio. I got an error message stating the radio is not responding. My serial port is Com 1, 9600, Xon/Xoff No where in the meager DOS instructions that came with this software does it say what the comm settings should be on com1 or com 2 if you are usingf that port. Does anyone out there have any comments/suggestions for me, Also is it possible to clone both VHF and UHF repeaters in one file with out changing to UHF/VHF. As I said the instructions are really meager for my pea-sized brain... Thank you...

IIRC (it's been 50 years since I studied this) a Y-Y circuit
has problems with in-phase circulating third harmonic currents
flowing on the neutral.

Body handling: Inline uuencoded payload not displayed: Tim Wescott.vcf

I'm working on getting active again, and I need batteries for my two handhelds. I've got a Yaesu FT-23R and an ICOM 24-AT. I've found batteries on the web for the FT-23R, but I've not had success with the 24-AT. I see packs for the ICOM 2-AT, which I believe would fit the 24-AT, but I'd like to _know_ before I plunk down a whole bunch of $$.

Can anyone give me recommendations on which battery vendors are good, which ones would have packs to fit my radios, and where to go for that pesky ICOM battery set?

Thanks all.

Tim Wescott

Icom IC-2SAT batteries are the same as for an IC-24AT. I think the 2AT may
be a different radio. Either way, a great source for replacements for most
Icom radios is Sunn Battery (www.sunnbattery.com)

> phases? Why not plain ole hot & neutral?

It comes from a standard sum that relates the power
capacity of electrical machinery to the number of
phases. Often shown in old elec eng textbooks.

In the example given in the textbook here he develops
sums for the relative power output for various phases,
for an ac motor of fixed frame size.

The baseline 1-phase motor is given a power output of P1.

A 2-phase motor in the same frame size would develop
a power output of P2= 1.414*P1.

A 3-phase motor would develop P3= 1.5*P1.

An m-phase motor (where m is an arbitrarily large number)
would develop Pm= 1.57*P1.

Pm is only 7% larger than P3, and so not worth the
complication. So P3 became the practical optimum number
of phases.

The same sum can be broadly applied to rotating machines,
transformers, and transmission gear.

Industrial-strength rectifiers do use transformers
sets that supply 6 phases.

Severe thread drift here..... An interesting use of
filterless multi-phase rectification was in amplitude
stabilising of RC oscillators. No filter cap meant
a fast response to changes, without bounce. Made
obsolete when cheap analogue multipliers came along,
(rectification via sine-squared_plus_cos-squared).

> are the common voltages?

Most the three phase I see runs 120v from two of the legs to ground.
The third leg is 240v to ground. Many residential A/C units used to
use three phase power here, if you had the power co. wire you up that
way. But they are getting much less common now as far as the smaller
residential units. You used to see a pretty decent advantage if you
ran three phase in the old days, but not much now. The newer single
phase units are more efficient than the older three phase with less
efficient coils, etc. I don't think the power co. will even hook you
up three phase anymore around this town for residential. Or if they
do, they will charge you three arms and a leg to do it. I think they
have to switch pole transformers. Many existing three phase units get
changed over to single phase when they die. Only the bigger units are
staying with three phase. IE: some 5 ton, 7.5 ton, etc...All you do to
switch three phase to single phase is tape off the 240 to ground line,
and use the other two as 240 single phase. You stay with three wires,
but the third becomes neutral instead of a hot 240v. BTW, the "240v"
here in Houston is pretty hot. I measure up to 248 volts at times at
this house. Needless to say, my henry amp usually has a happy plate
voltage..:)
I can't adjust the tap...The freakin 2k classic I have is about the
only henry console made that you can't adjust the line tap. Most have
multiple taps..But nooooooooo, not mine...:/ I run up to 3400v at
times. Bet my filament voltage is hot too...:(MK

>The third leg is 240v to ground.

This is a very special US technique, using a transformer with a delta-
connected secondary (like an equilateral triangle of windings), with one
winding centre-tapped and grounded.

In most countries, all three phase voltages are equal.

One hot leg, 230V single phase, our three phase is formed from another two
230V phases at 120 degree phase angle to one another so we get 400V between
phases.

To keep the load even, it's common to run things like warehouse lights on
all three phases of the incoming supply.

another difference is we (Europeans) run at 50 Hz, while Americans use 60
Hz.

Interesting. Did that use a transformer arrangement using quadrature
input (wide frequency range) or some kind of RC kludge?

Not so. I worked all over Christmas except on the day itself, when I
only had about an hour's discussion on balanced input stages and
headphone sound level control circuits. (;-)

As a result, the presentation that I'm working on has ground to a halt
because I can't concentrate. So I'm clearing up a few other jobs
instead. (More audio interconnection stuff and induction loops.)

But I ALWAYS make time for whimsy.

John,

Windows XP came out after I left Icom. I have read several times about
XP limiting the control of ports like the serial and parallel port
from DOS programs.

I have little experience so far except for a home controller which I
can't seem to talk to through Windows XP using a DOS program.

A net search does show some external TSR like programs that allow the
DOS programs to work through XP. Others here may have different
experiences.

I am looking for a ham operator, that I bought a two meter horz
groundplane bigwheel antenna from several years ago, at Belton
Texas. He built both two/440mhz antennas. I 'think' he lived in Dallas
and just came down to Belton for the hamfest. Would like to get back in
touch,if possible, to purchase another two meter, like the one I have.
thanks in advance. 73

My initial reaction to that question was "goodness no!". Then, before I put my foot in my mouth, I checked the Digi-Key catalog:

A Triad CME375-5 inductor for switched-mode power supplies is 28.6uH at 2.2A, and measures 32x38x30mm, for a volume of around 36cc. If you run it right at it's current limit you can store (28.6uH)(2.2A)^2/2 = 70uJ (micro-joules) of energy, or about 2 micro-joules/cc.

A Kemet T350E106K016A5 tantalum cap is 10uF, 16V, 5.5x5.5x8.9mm, volume = 0.27cc. Unlike an inductor which won't be permentantly damaged by overcurrernt your cap will explode if it's subjected to overvoltage, so you _never_ run it more than 10V. Given that you can store (10uF)(10V)^2/2 = 500uJ, or about 1800uJ/cc -- and capacitors are much less dense than inductors, so they'll weigh less for the volume.

This is why, when you're designing a power supply with inductors (1MHz switched or brute-force 60Hz), you usually design the inductor to have it's current swing from nearly zero (or all the way to zero) up to nearly it's maximum. This extracts nearly all the stored energy from the inductor each cycle. On the other hand you use the capacitors to reduce ripple by having their voltage vary a tiny fraction of the total, thereby letting lots of energy just sit there doing no work.

Even though nothing obvious may have changed with the antenna, get hold of an antenna analyzer and check it. The connection of the feedline to the antenna may have deteriorated. If you are using coax, water may have gotten in the line. The joints of the connectors to the line may have deteriorated. The MFJ antenna analyzer lets you check the impedance and loss of the line itself. You have to disconnect the line from the antenna when you are checking the line only.

Note if you had a carbon buildup before, that indicated something else was wrong with your system. Carbon occurs when something burns. Quite possibly your tuner has been arcing because something is off with the antenna and has always been off. Then when the carbon builds up, it won't work.

If you are using a properly cut 10m dipole on 10meters, you really shouldn't need the tuner at all unless you are at the extremes of the band. What is your SWR reading when you don't use the tuner?

Also burned on carbon deposits may not be removable with the simple spray cleaners and if that problem has recurred you may indeed need to take it back to the repair tech to have it removed.

I'll reply to this one also.

Isn't it interesting that a guy whose supposed email address is
me@PRIVACY.net would spam 4, count'em 4 newsgroups, with a product that
is not relevant to two of them and barely relevant to one, and won't
observe the courtesy of putting "FA" at the front of his post header.

I still don't mind FA posts, but I do mind non-relevant and discourteous
posts.

Depends on what you want...

I assume you're looking for ham radio stuff...

For well designed, relatively inexpensive kits, try Small Wonder Labs...
http://www.smallwonderlabs.com/
Really well engineered stuff, and Dave is a great guy.

For high-end kits, Elecraft: http://www.elecraft.com/
Excellent design, quality, & performance but not cheap.

Ten-tec still sells kits: http://www.tentec.com/Amateur.htm

Many of the QRP clubs offer decent, inexpensive kits from time to time.

I'm sure there are others...

Any of these will likely be much better than something from Ramsey, altho
probably a bit more expensive (but worth it in the long run)...

No financial interest in any of the above, just passing along info...

Once you have the basic six phases, the addition of small "interphase
transformers" or windings here and there can create any number of
additional phases at small added expense. 24 phase rectifiers are
common in big DC systems.

John

|> | harmonising on a nominal 230V.
|>
|> Is that with one hot leg or two? If you get three phase power there, what
|> are the common voltages?
|>
| One hot leg, 230V single phase, our three phase is formed from another two
| 230V phases at 120 degree phase angle to one another so we get 400V between
| phases.
|
| To keep the load even, it's common to run things like warehouse lights on
| all three phases of the incoming supply.
|
| another difference is we ( Europeans ) run at 50 Hz, while Americans use 60
| Hz.

At least Europe can share power around the continent as needed. Japan is
split frequency (50 Hz in the east, 60 Hz in the west) making that much
harder to do. I guess that's why they came up with all the 50/60 Hz stuff
and the 100-250 volt ranges (their voltage is 100/200).

|
| So do other people, but it's an inflammatory issue with some US experts.

It's called "2 pole".

There are no bad puns, but some are worse than others. Puns about German
sausages are the Wurst.

Seasonal felicitations.

110V should be within the tolerance - IOW, it wasn't the lower voltage that
it didn't like running on, but something else. Typically "120V" equipment
can
run from 105-125.

No, he can tell the difference between right and left. It's still one
dimension.

The difference is the difference between right/left and up/down, or
right/left, up 120 deg down 300 deg, up 240 deg. down 420 deg. for
3-phase.

But a center-tapped transformer gives you ONE PHASE. There is no
phase rotation, it's simply the inversion.

Take, for example, a pulse train:

Now, invert it:

This is clearly _NOT_ the original shifted 180 degrees.

THIS

is the original shifted 180 degrees.

Can you kids now see the difference between a 180 degree
phase shift and a simple inversion?

Thank you.
Rich

>Spehro Pefhany

Dunno... most of my shipboard experience was on steam turbine plants.
Some ships are diesel-electrics, so may have big rectifiers somewhere.
I have seen 24-phase SCR supplies driving motors or something, but I
can't recall where... locomotives maybe.

Lots of ships are diesel these days, because the plants are small,
simple, and reliable compared to steam. Many are direct, 1:1 shaft
drive using reversible diesels. Many ships have small electric "take
home" motors powered off the aux diesel generators.

>
Sadly, yes. At least it seemed like it - a multi-signal connector deep
within the bowels of the fuselage of an F-4 Phantom Jet, just above
the exhausts, sitting/lying/crouching on a bed-of-nails of sheet metal
screws poking through the skin of the airplane. I had to do the work
because I was the one who found the break with a TDR. It wasn't that
bad - holding the connector and wire and replacement pin with one
hand, the Tech Order with the other hand, the flashlight with the other
hand, the soldering iron with the other hand, the solder in my teeth;
And don't forget the crimping tool and Cannon Plug Pliers.

I remember following the wire bundle along the skin, where other crews
had taken off the panels, and reached a point where it took a 90 deg.
turn directly into the fuselage. I said to my cow-orker, "It's
4 feet from here, that way." pointing toward the centerline of the
airplane. He said, "Have fun!" It took three other guys just to remove
all the crap to get access to where the connector was. (things like
"control feel bellows" and linkages and fuel and hydraulic lines and
wires, and wires, and wires...)

Cheers!
Rich

Not on a sine wave, no. But it's a futile discussion: neither opinion
will ever be abandoned.

I have new old stock NE-51 neon shorts bulbs from 1964 available.

these are the shorts bulbs used on TV-2 series military tube testers and are also the pilot lamp on the TV-2

they are also the shorts bulb on Hickok 539C and 533A as well as some Hickok 539B's and some Hickok 533's and the equivalent Western Electric and RD Instruments testers.

the NOS NE-51's are 2 for $6 - free shipping

also have a few NOS NE-45 from 1966 for $11 each for TV-7, TV-3, and TV-10 and many Hickok models.

I also stock #81, #47, #49, #12, #44, #51 #46 etc. new old stock

write me at cacheoverflow@yahoo.com

cheers!

Not as long as SIN X = - SIN (X + 180)

There is no difference with a sine wave.

Can you give me details of any test you use to detect the difference ?
